### **B. INVASIVENESS RANKING**

1. ECOLOGICAL IMPACT

regi nuti	me, rient	pact on Natural Ecosystem Processes and System-Wide Parameters (e.g. f geomorphological changes (erosion, sedimentation rates), hydrologic reg and mineral dynamics, light availability, salinity, pH)	gime,	
	A.	No perceivable impact on ecosystem processes based on research studies, or the absence impact information if a species is widespread (>10 occurrences in minimally managed areas), has been well-studied (>10 reports/publications), and has been present in the northeast for >100 years.		0
	B.	Influences ecosystem processes to a minor degree (e.g., has a perceivable but mild infl on soil nutrient availability)	uence	3
	C.	Significant alteration of ecosystem processes (e.g., increases sedimentation rates along		7
	D.	streams or coastlines, reduces open water that are important to waterfowl) Major, possibly irreversible, alteration or disruption of ecosystem processes (e.g., the species alters geomorphology and/or hydrology, affects fire frequency, alters soil pH, of fixes substantial levels of nitrogen in the soil making soil unlikely to support certain naplants or more likely to favor non-native species)		10
	U.	Unknown	Score	10
		Documentation:	Score	10
		Identify ecosystem processes impacted (or if applicable, justify choosing answer A in tabsence of impact information)		
		Species is capable of nitrogen fixation and thus altering soil chemistry and the nitroger cycle.  Sources of information:	1	
		Fessenden, 1979; Pascke et al., 1980.		
1.2.	Imp	oact on Natural Community Structure		
	A.	No perceived impact; establishes in an existing layer without influencing its structure		0
	B.	Influences structure in one layer (e.g., changes the density of one layer)		3
	C.	Significant impact in at least one layer (e.g., creation of a new layer or elimination of a existing layer)		7
	D. U.	Major alteration of structure (e.g., covers canopy, eradicating most or all layers below) Unknown	1	10

#### C. STATUS OF CULTIVARS AND HYBRIDS:

At the present time (May 2008) there is no protocol or criteria for assessing the invasiveness of cultivars independent of the species to which they belong. Such a protocol is needed, and individuals with the appropriate expertise should address this issue in the future. Such a protocol will likely require data on cultivar fertility and identification in both experimental and natural settings.

Hybrids (crosses between different parent species) should be assessed individually and separately from the parent species wherever taxonomically possible, since their invasiveness may differ from that of the parent species. An exception should be made if the taxonomy of the species and hybrids are uncertain,

and species and hybrids can not be clearly distinguished in the field. In such cases it is not feasible to distinguish species and hybrids, and they can only be assessed as a single unit.

Some cultivars of the species known to be available:
