NEW YORK
NON-NATIVE PLANT INVASIVENESS RANKING FORM

Scientific name: Fallopia japonica (Hout.) Dcne. var. japonica, F. sachalinensis, F. xbohemica (Polygonum cuspidatum, P. sachalinense, P. xboehmicum)
USDA Plants Code: POCU6, POSA4, POBO10

Common names: Japanese knotweed, giant knotweed
Native distribution: Asia (China, Japan Korea)
Date assessed: 26 April 2008
Assessors: Gerry Moore
Reviewers: LIISMA SRC
Date Approved: 2008/05/11 Form version date: 10 July 2009

New York Invasiveness Rank: Very High (Relative Maximum Score >80.00)

Distribution and Invasiveness Rank (Obtain from PRISM invasiveness ranking form)

* For questions answered “unknown” do not include point value in “Total Answered Points Possible.” If “Total Answered Points Possible” is less than 70.00 points, then the overall invasive rank should be listed as “Unknown.”
†Calculated as 100(a/b) to two decimal places.
§Very High >80.00; High 70.00−80.00; Moderate 50.00−69.99; Low 40.00−49.99; Insignificant <40.00
Not Assessable: not persistent in NY, or not found outside of cultivation.

A. DISTRIBUTION (KNOWN/POTENTIAL): Summarized from individual PRISM forms

A1.1. Has this species been documented to persist without cultivation in NY? (reliable source; voucher not required)

☑️ Yes – continue to A1.2
☐ No – continue to A2.1

A1.2. In which PRISMs is it known (see inset map)?

☑️ Adirondack Park Invasive Program
☑️ Capital/Mohawk
☑️ Catskill Regional Invasive Species Partnership
☑️ Finger Lakes
☑️ Long Island Invasive Species Management Area
☑️ Lower Hudson
☑️ Saint Lawrence/Eastern Lake Ontario
☑️ Western New York

Partnerships for Regional INVASIVE SPECIES MANAGEMENT 2008

**NEW YORK**

**NON-NATIVE PLANT INVASIVENESS RANKING FORM**

**Documentation:**
Sources of information:
These two species have recently been shown to hybridize extensively (Gammon, 2007) and this warrants treating them and their hybrid as a single unit for the purpose of evaluating invasiveness. New York Flora Atlas, 2008; Brooklyn Botanic Garden, 2008.

**A2.1.** What is the likelihood that this species will occur and persist outside of cultivation, given the climate in the following PRISMs? (obtain from PRISM invasiveness ranking form)

<table>

B. INVASIVENESS RANKING
Questions apply to areas similar in climate and habitats to New York unless specified otherwise.

1. ECOLOGICAL IMPACT

1.1. Impact on Natural Ecosystem Processes and System-Wide Parameters (e.g. fire regime, geomorphological changes (erosion, sedimentation rates), hydrologic regime, nutrient and mineral dynamics, light availability, salinity, pH)

A. No perceivable impact on ecosystem processes based on research studies, or the absence of impact information if a species is widespread (>10 occurrences in minimally managed areas), has been well-studied (>10 reports/publications), and has been present in the northeast for >100 years. 0

B. Influences ecosystem processes to a minor degree (e.g., has a perceivable but mild influence on soil nutrient availability) 3

C. Significant alteration of ecosystem processes (e.g., increases sedimentation rates along streams or coastlines, reduces open water that are important to waterfowl) 7

D. Major, possibly irreversible, alteration or disruption of ecosystem processes (e.g., the species alters geomorphology and/or hydrology, affects fire frequency, alters soil pH, or fixes substantial levels of nitrogen in the soil making soil unlikely to support certain native plants or more likely to favor non-native species) 10

U. Unknown

Score 10

Documentation:
Identify ecosystem processes impacted (or if applicable, justify choosing answer A in the absence of impact information)
Overwintering dead material is a fire and flood hazard (Czarapata, 2005) and is slow to decompose creating an extensive organic layer above soil or in O horizon of soil (Alaska Natural Heritage Program, author's (Moore's) pers. obs.)
Sources of information:
Czarapata, 2005; author's (Moore's) pers. observations.

1.2. Impact on Natural Community Structure

A. No perceived impact; establishes in an existing layer without influencing its structure 0

B. Influences structure in one layer (e.g., changes the density of one layer) 3

C. Significant impact in at least one layer (e.g., creation of a new layer or elimination of an existing layer) 7

D. Major alteration of structure (e.g., covers canopy, eradicating most or all layers below) 10

U. Unknown

Score 10

Documentation:
Identify type of impact or alteration:
Plant's early emergence and rapid growth and persistence of dead material from previous year's growth can eradicate all layers below.
Sources of information:
Sukopp & Sukkopp, 1988; Soll 2004; author's (Moore's) pers. obs.

1.3. Impact on Natural Community Composition

A. No perceived impact; causes no apparent change in native populations 0

B. Influences community composition (e.g., reduces the number of individuals in one or more native species in the community) 3

C. Significantly alters community composition (e.g., produces a significant reduction in the population size of one or more native species in the community) 7

Score
### New York
NON-NATIVE PLANT INVASIVENESS RANKING FORM

<table>
<thead>
<tr>
<th>Score</th>
<th>10</th>
</tr>
</thead>
</table>

D. Causes major alteration in community composition (e.g., results in the extirpation of one or several native species, reducing biodiversity or change the community composition towards species exotic to the natural community)  

<table>
<thead>
<tr>
<th>U. Unknown</th>
<th>10</th>
</tr>
</thead>
</table>

**Documentation:**  
Identify type of impact or alteration:  
Can form monocultures and prevent the growth of native species in lower layers.  
Sources of information:  
Seiger, 1991; Sukopp & Sukkopp, 1988; Soll 2004; author's (Moore's) pers. obs.

1.4. Impact on other species or species groups (cumulative impact of this species on the animals, fungi, microbes, and other organisms in the community it invades. Examples include reduction in nesting/foraging sites; reduction in habitat connectivity; injurious components such as spines, thorns, burrs, toxins; suppresses soil/sediment microflora; interferes with native pollinators and/or pollination of a native species; hybridizes with a native species; hosts a non-native disease which impacts a native species)  

| A. Negligible perceived impact | 0 |
| B. Minor impact | 3 |
| C. Moderate impact | 7 |
| D. Severe impact on other species or species groups | 10 |
| U. Unknown | 10 |

**Documentation:**  
Identify type of impact or alteration:  
In Alaska, it has been shown to reduce the food supply for juvenile salmon; no data available on its impacts to specific species of animal in New York. Displaced native plant species in western Pennsylvania.  
Sources of information:  
Alaska Natural Heritage Program, no date; M. Esch, 2004.

Total Possible: 40  
Section One Total: 40

---

### 2. Biological Characteristics and Dispersal Ability

2.1. Mode and rate of reproduction  

| A. No reproduction by seeds or vegetative propagules (i.e. plant sterile with no sexual or asexual reproduction). | 0 |
| B. Limited reproduction (fewer than 10 viable seeds per plant AND no vegetative reproduction; if viability is not known, then maximum seed production is less than 100 seeds per plant and no vegetative reproduction) | 1 |
| C. Moderate reproduction (fewer than 100 viable seeds per plant - if viability is not known, then maximum seed production is less than 1000 seeds per plant - OR limited successful vegetative spread documented) | 2 |
| D. Abundant reproduction with vegetative asexual spread documented as one of the plants prime reproductive means OR more than 100 viable seeds per plant (if viability is not known, then maximum seed production reported to be greater than 1000 seeds per plant.) | 4 |
| U. Unknown | 4 |

**Documentation:**  
Describe key reproductive characteristics (including seeds per plant):
2.2. Innate potential for long-distance dispersal (e.g. bird dispersal, sticks to animal hair, buoyant fruits, pappus for wind-dispersal)

<p>| | | |</p>
<table>
<thead>
<tr>

<td>Unknown</td>
<td>Score 6</td>
</tr>
</tbody>
</table>

Documentation:
Evidence of competitive ability:
Rapid growth up to 8 cm/day; perennial habit.
Sources of information:

2.5. Growth vigor
A. Does not form thickets or have a climbing or smothering growth habit
B. Has climbing or smothering growth habit, forms a dense layer above shorter vegetation, forms dense thickets, or forms a dense floating mat in aquatic systems where it smothers other vegetation or organisms
U. Unknown

Documentation:
Describe growth form:
Rapid growth smothering vegetation beneath it; overwintering material also smothers vegetation.
Sources of information:
Czarapata, 2005.

Score 2

2.6. Germination/Regeneration
A. Requires open soil or water and disturbance for seed germination, or regeneration from vegetative propagules.
B. Can germinate/regenerate in vegetated areas but in a narrow range or in special conditions
C. Can germinate/regenerate in existing vegetation in a wide range of conditions
U. Unknown (No studies have been completed)

Documentation:
Describe germination requirements:
Can germinate in a variety of conditions.
Sources of information:

Score 3

2.7. Other species in the genus invasive in New York or elsewhere
A. No
B. Yes
U. Unknown

Documentation:
Species:
possibly invasive: Fallopia baldschuaniaca, Fallopia convolvulus, Fallopia dumetorum.

Score 3

3. ECOLOGICAL AMPLITUDE AND DISTRIBUTION

3.1. Density of stands in natural areas in the northeastern USA and eastern Canada (use same definition as Gleason & Cronquist which is: “The part of the United States covered extends from the Atlantic Ocean west to the western boundaries of Minnesota, Iowa, northern Missouri, and southern Illinois, south to the southern boundaries of Virginia, Kentucky, and Illinois, and south to the Missouri River in Missouri. In Canada the area covered includes Nova Scotia, Prince Edward Island, New Brunswick, and parts of Quebec and Ontario lying south of the 47th parallel of latitude”)

A. No large stands (no areas greater than 1/4 acre or 1000 square meters)

Score 0
### New York

#### 3.5. Current introduced distribution in the northeastern USA and eastern Canada (see
question 3.1 for definition of geographic scope )

A. Not known from the northeastern US and adjacent Canada 0
B. Present as a non-native in one northeastern USA state and/or eastern Canadian province. 1
C. Present as a non-native in 2 or 3 northeastern USA states and/or eastern Canadian provinces. 2
D. Present as a non-native in 4–8 northeastern USA states and/or eastern Canadian provinces, and/or categorized as a problem weed (e.g., “Noxious” or “Invasive”) in 1 northeastern state or eastern Canadian province. 3
E. Present as a non-native in >8 northeastern USA states and/or eastern Canadian provinces, and/or categorized as a problem weed (e.g., “Noxious” or “Invasive”) in 2 northeastern states or eastern Canadian provinces. 4
U. Unknown Score 4

Documentation:
Identify states and provinces invaded:
United States: AR, CA, CO, CT, DC, DE, GA, IA, ID, IL, IN, KS, KY, LA, MA, MD, ME, MI, MN, MO, MS, NC, NH, NJ, NY, OH, OR, PA, RI, SC, TN, UT, VA, VT, WA, WI, WV.
Canada: BC, MB, NB, NF, NS, ON, PE, QC.
Sources of information: See known introduced range in plants.usda.gov, and update with information from states and Canadian provinces. USDA.gov

3.6. Current introduced distribution of the species in natural areas in the eight New York State PRISMs (Partnerships for Regional Invasive Species Management)

A. Present in none of the PRISMs 0
B. Present in 1 PRISM 1
C. Present in 2 PRISMs 2
D. Present in 3 PRISMs 3
E. Present in more than 3 PRISMs or on the Federal noxious weed lists 4
U. Unknown Score 4

Documentation:
Describe distribution:
Found throughout the state.
Sources of information:

Total Possible 25
Section Three Total 23

4. DIFFICULTY OF CONTROL

4.1. Seed banks

A. Seeds (or vegetative propagules) remain viable in soil for less than 1 year, or does not make viable seeds or persistent propagules. 0
B. Seeds (or vegetative propagules) remain viable in soil for at least 1 to 10 years 2
C. Seeds (or vegetative propagules) remain viable in soil for more than 10 years 3
U. Unknown Score U
Documentation:
Identify longevity of seed bank:
While seed production is high, information could not be obtained on how long seeds can remain viable.
Sources of information:

4.2. Vegetative regeneration
A. No regrowth following removal of aboveground growth 0
B. Regrowth from ground-level meristems 1
C. Regrowth from extensive underground system 2
D. Any plant part is a viable propagule 3
U. Unknown 3
Score 3

Documentation:
Describe vegetative response:
Plants can reproduce sexually through seed production or asexually through stem and root fragments.
Sources of information:
Meyers-Rice, 2000; Shaw and Sieger, 2002; Tull & Soll, 2004; Soll, 2004; author's (Moore's) pers. obs.

4.3. Level of effort required
A. Management is not required: e.g., species does not persist without repeated anthropogenic disturbance. 0
B. Management is relatively easy and inexpensive: e.g. 10 or fewer person-hours of manual effort (pulling, cutting and/or digging) can eradicate a 1 acre infestation in 1 year (infestation averages 50% cover or 1 plant/100 ft²). 2
C. Management requires a major short-term investment: e.g. 100 or fewer person-hours/year of manual effort, or up to 10 person-hours/year using mechanical equipment (chain saws, mowers, etc.) for 2-5 years to suppress a 1 acre infestation. Eradication is difficult, but possible (infestation as above). 3
D. Management requires a major investment: e.g. more than 100 person-hours/year of manual effort, or more than 10 person hours/year using mechanical equipment, or the use of herbicide, grazing animals, fire, etc. for more than 5 years to suppress a 1 acre infestation. Eradication may be impossible (infestation as above). 4
U. Unknown 4
Score 4

Documentation:
Identify types of control methods and time-term required:
Extremely difficult to eradicate or control once established.
Sources of information:

Total Possible 7
Section Four Total 7

Total for 4 sections Possible 97
Total for 4 sections 95

C. STATUS OF CULTIVARS AND HYBRIDS:
Information in this section may be useful for assessing the invasiveness of particular species, for developing strategies for prevention/early detection of potential new invaders, and for assessing economic and human health impacts. No scores are given to this section at this time, though these factors are important. In the future, separate assessments for economic impacts, human health impacts, agricultural
impacts, and other categories may need to be developed in order to arrive at an overall NYS invasiveness rank that takes all factors into account.

At the present time (May 2008) there is no protocol or criteria for assessing the invasiveness of cultivars independent of the species to which they belong. Such a protocol is needed, and individuals with the appropriate expertise should address this issue in the future. Such a protocol will likely require data on cultivar fertility and identification in both experimental and natural settings.

Hybrids (crosses between different parent species) should be assessed individually and separately from the parent species wherever taxonomically possible, since their invasiveness may differ from that of the parent species. An exception should be made if the taxonomy of the species and hybrids are uncertain, and species and hybrids can not be clearly distinguished in the field. In such cases it is not feasible to distinguish species and hybrids, and they can only be assessed as a single unit.

Some cultivars of the species known to be available:

**References for species assessment:**
