NEW YORK
NON-NATIVE PLANT INVASIVENESS RANKING FORM

Scientific name: Coronilla varia (Securigera varia) USDA Plants Code: SEVA4
Common names: Crownvetch
Native distribution: Eurasia
Date assessed: Jan 12, 2009
Assessors: Jinshuang Ma, Gerry Moore
Reviewers: LIISMA SRC
Date Approved: 28 Jan. 2009 Form version date: 22 October 2008

New York Invasiveness Rank: Moderate (Relative Maximum Score 50.00-69.99)

Distribution and Invasiveness Rank (Obtain from PRISM invasiveness ranking form)

#### A2.3. Describe the potential or known suitable habitats within New York. Natural habitats include all habitats not under active human management. Managed habitats are indicated with an asterisk.

- **Aquatic Habitats**
  - Salt/brackish waters
  - Freshwater tidal
  - Rivers/streams
  - Natural lakes and ponds
  - Vernal pools
  - Reservoirs/impoundments*

- **Wetland Habitats**
  - Salt/brackish marshes
  - Freshwater marshes
  - Peatlands
  - Shrub swamps
  - Forested wetlands/riparian
  - Ditches*

- **Upland Habitats**
  - Cultivated*
  - Grasslands/old fields
  - Shrublands
  - Forests/woodlands
  - Alpine
  - Roadsides*
  - Beaches and/or coastal dunes

**Documentation:**
Sources of information:
Weldy & Werier, 2008; Brooklyn Botanic Garden, 2009.

---

Other potential or known suitable habitats within New York:
B. INVASIVENESS RANKING

1. ECOLOGICAL IMPACT

1.1. Impact on Natural Ecosystem Processes and System-Wide Parameters (e.g. fire regime, geomorphological changes (erosion, sedimentation rates), hydrologic regime, nutrient and mineral dynamics, light availability, salinity, pH)

A. No perceivable impact on ecosystem processes based on research studies, or the absence of impact information if a species is widespread (>10 occurrences in minimally managed areas), has been well-studied (>10 reports/publications), and has been present in the northeast for >100 years.

B. Influences ecosystem processes to a minor degree (e.g., has a perceivable but mild influence on soil nutrient availability)

C. Significant alteration of ecosystem processes (e.g., increases sedimentation rates along streams or coastlines, reduces open water that are important to waterfowl)

D. Major, possibly irreversible, alteration or disruption of ecosystem processes (e.g., the species alters geomorphology and/or hydrology, affects fire frequency, alters soil pH, or fixes substantial levels of nitrogen in the soil making soil unlikely to support certain native plants or more likely to favor non-native species)

U. Unknown

Score 7

Documentation:
Identify ecosystem processes impacted (or if applicable, justify choosing answer A in the absence of impact information)
Species fixes nitrogen, enriching the soil. When C. varia invades new habitats, there is an increase in soil nitrogen, as well as changes to the overall fuel load in fire-adapted communities. While species has been noted on infertile soils, large stands have not been noted in nutrient poor systems (e.g., pine barrens) where the impacts of nitrogen fixation and nutrient enrichment would be more pronounced, and could lead to a cascade of other invasive species invasions (such as with Robinia pseudoacacia).

Sources of information:
Tu, 2003; Lu, 2004; author's (Moore's) pers. obs.

1.2. Impact on Natural Community Structure

A. No perceived impact; establishes in an existing layer without influencing its structure

B. Influences structure in one layer (e.g., changes the density of one layer)

C. Significant impact in at least one layer (e.g., creation of a new layer or elimination of an existing layer)

D. Major alteration of structure (e.g., covers canopy, eradicating most or all layers below)

U. Unknown

Score 3

Documentation:
Identify type of impact or alteration:
Can increase the density of the herb layer; no evidence of elimination or creation of new layers.

Sources of information:
Tu, 2003; Lu, 2004; author's (Moore's) pers. obs.

1.3. Impact on Natural Community Composition

A. No perceived impact; causes no apparent change in native populations

B. Influences community composition (e.g., reduces the number of individuals in one or more native species in the community)

C. Significantly alters community composition (e.g., produces a significant reduction in the population size of one or more native species in the community)

D. Causes major alteration in community composition (e.g., results in the extirpation of one or more species)

Score 7

Documentation:
Identify type of impact or alteration:

Sources of information:
Tu, 2003; Lu, 2004; author's (Moore's) pers. obs.
several native species, reducing biodiversity or change the community composition towards species exotic to the natural community

U. Unknown  

**Documentation:**
Identify type of impact or alteration:
Can form large stands resulting in the reduction of native species through shading.
Observation of this species in the New York area and surrounding states has shown that the exceptionally large stands that are noted are usually within areas where the plant has been planted for soil stabilization after the clearance of the existing vegetation (e.g., slopes along highways) or along nearby roadsides.
Sources of information:
Lu, 2004; author's (Moore's) pers. obs.

1.4. Impact on other species or species groups (cumulative impact of this species on the animals, fungi, microbes, and other organisms in the community it invades. Examples include reduction in nesting/foraging sites; reduction in habitat connectivity; injurious components such as spines, thorns, burrs, toxins; suppresses soil/sediment microflora; interferes with native pollinators and/or pollination of a native species; hybridizes with a native species; hosts a non-native disease which impacts a native species)

- A. Negligible perceived impact 0
- B. Minor impact 3
- C. Moderate impact 7
- D. Severe impact on other species or species groups 10
- U. Unknown  

**Documentation:**
Identify type of impact or alteration:
Studies on impacts to other species or species groups not known. Some reports of toxicity to some livestock (e.g., horses).
Sources of information:
Tu, 2003; Lu, 2004; Southeast Exotic Pest Plant Council, 2008.

Total Possible 30
Section One Total 13

### 2. BIOLOGICAL CHARACTERISTICS AND DISPERSAL ABILITY

#### 2.1. Mode and rate of reproduction (provisional thresholds, more investigation needed)

- A. No reproduction by seeds or vegetative propagules (i.e. plant sterile with no sexual or asexual reproduction).
- B. Limited reproduction (fewer than 10 viable seeds per plant AND no vegetative reproduction; if viability is not known, then maximum seed production is less than 100 seeds per plant and no vegetative reproduction)
- C. Moderate reproduction (fewer than 100 viable seeds per plant - if viability is not known, then maximum seed production is less than 1000 seeds per plant - OR limited successful vegetative spread documented)
- D. Abundant reproduction with vegetative asexual spread documented as one of the plants prime reproductive means OR more than 100 viable seeds per plant (if viability is not known, then maximum seed production reported to be greater than 1000 seeds per plant.)
- U. Unknown  

**Score** 4
### Documentation:
Describe key reproductive characteristics (including seeds per plant):
Proflific seed set (100s) vegetative spread through rhizome growth.
Sources of information:
Tu, 2003; author's (Moore's) pers. obs.

#### 2.2. Innate potential for long-distance dispersal (e.g. bird dispersal, sticks to animal hair, buoyant fruits, pappus for wind-dispersal)

<table>
<thead>
<tr>
<th>Option</th>
<th>Score</th>
</tr>
</thead>
<tbody>
<tr>
<td>A. Does not occur (no long-distance dispersal mechanisms)</td>
<td>0</td>
</tr>
<tr>
<td>B. Infrequent or inefficient long-distance dispersal (occurs occasionally despite lack of adaptations)</td>
<td>1</td>
</tr>
<tr>
<td>C. Moderate opportunities for long-distance dispersal (adaptations exist for long-distance dispersal, but studies report that 95% of seeds land within 100 meters of the parent plant)</td>
<td>2</td>
</tr>
<tr>
<td>D. Numerous opportunities for long-distance dispersal (adaptations exist for long-distance dispersal and evidence that many seeds disperse greater than 100 meters from the parent plant)</td>
<td>4</td>
</tr>
<tr>
<td>U. Unknown</td>
<td></td>
</tr>
</tbody>
</table>

Score: 1

#### Documentation:
Identify dispersal mechanisms:
Small seeds could occasionally be dispersed by animals. No long distance dispersal mechanisms apparent.
Sources of information:
Lu, 2004; author's (Moore's) pers. obs.

#### 2.3. Potential to be spread by human activities (both directly and indirectly – possible mechanisms include: commercial sales, use as forage/revegetation, spread along highways, transport on boats, contaminated compost, land and vegetation management equipment such as mowers and excavators, etc.)

<table>
<thead>
<tr>
<th>Option</th>
<th>Score</th>
</tr>
</thead>
<tbody>
<tr>
<td>A. Does not occur</td>
<td>0</td>
</tr>
<tr>
<td>B. Low (human dispersal to new areas occurs almost exclusively by direct means and is infrequent or inefficient)</td>
<td>1</td>
</tr>
<tr>
<td>C. Moderate (human dispersal to new areas occurs by direct and indirect means to a moderate extent)</td>
<td>2</td>
</tr>
<tr>
<td>D. High (opportunities for human dispersal to new areas by direct and indirect means are numerous, frequent, and successful)</td>
<td>3</td>
</tr>
<tr>
<td>U. Unknown</td>
<td></td>
</tr>
</tbody>
</table>

Score: 3

#### Documentation:
Identify dispersal mechanisms:
Planted for erosion control along highways and to stabilize and improve soils; indirect spread possible by movement of contaminated soil.
Sources of information:
Smith, 1993; Tu, 2003; Lu, 2004; SEEPC, 2008

#### 2.4. Characteristics that increase competitive advantage, such as shade tolerance, ability to grow on infertile soils, perennial habit, fast growth, nitrogen fixation, allelopathy, etc.

<table>
<thead>
<tr>
<th>Option</th>
<th>Score</th>
</tr>
</thead>
<tbody>
<tr>
<td>A. Possesses no characteristics that increase competitive advantage</td>
<td>0</td>
</tr>
<tr>
<td>B. Possesses one characteristic that increases competitive advantage</td>
<td>3</td>
</tr>
<tr>
<td>C. Possesses two or more characteristics that increase competitive advantage</td>
<td>6</td>
</tr>
<tr>
<td>U. Unknown</td>
<td></td>
</tr>
</tbody>
</table>

Score: 6

#### Documentation:
Evidence of competitive ability:
Perennial habit, fast growth, nitrogen fixation; ability to grow on infertile soils.
Sources of information:
McKee et al, 1976; Brooklyn Botanic Garden 2009.

2.5. Growth vigor
A. Does not form thickets or have a climbing or smothering growth habit 0
B. Has climbing or smothering growth habit, forms a dense layer above shorter vegetation, forms dense thickets, or forms a dense floating mat in aquatic systems where it smothers other vegetation or organisms 2
U. Unknown

Score 2

Documentation:
Describe growth form:
Large stands can exhibit smothering growth.
Sources of information:

2.6. Germination/Regeneration
A. Requires open soil or water and disturbance for seed germination, or regeneration from vegetative propagules. 0
B. Can germinate/regenerate in vegetated areas but in a narrow range or in special conditions 2
C. Can germinate/regenerate in existing vegetation in a wide range of conditions 3
U. Unknown (No studies have been completed)

Score U

Documentation:
Describe germination requirements:
Studies not known on the germination requirements of the species. Use of microbial (Rhizobium) inoculant is recommended for seedling establishment in cultivation. Lack of inoculant in native soils may be inhibiting seedling establishment. Firm documentation on this hypothesis is lacking.
Sources of information:
LIISMA SRC pers. obs.

2.7. Other species in the genus invasive in New York or elsewhere

3. ECOLOGICAL AMPLITUDE AND DISTRIBUTION
3.1. Density of stands in natural areas in the northeastern USA and eastern Canada (use same definition as Gleason & Cronquist which is: “The part of the United States covered extends from the Atlantic Ocean west to the western boundaries of Minnesota, Iowa, northern Missouri, and southern Illinois, south to the southern boundaries of Virginia, Kentucky, and Illinois, and south to the Missouri River in Missouri. In Canada the area covered includes Nova Scotia, Prince Edward Island, New Brunswick, and parts of Quebec and Ontario lying south of the 47th parallel of
### New York
NON-NATIVE PLANT INVASIVENESS RANKING FORM

#### 3.1. Location near native range

A. No large stands (no areas greater than 1/4 acre or 1000 square meters)  
B. Large dense stands present in areas with numerous invasive species already present or disturbed landscapes  
C. Large dense stands present in areas with few other invasive species present (i.e. ability to invade relatively pristine natural areas)  
U. Unknown

Score 2

Documentation:
Identify reason for selection, or evidence of weedy history:
Plant is known and has been observed to invade pastures and fields where other non-natives are usually noted.
Sources of information:  
Tu, 2003; Lu, 2004; author's (Moore's) pers. obs.

#### 3.2. Number of habitats the species may invade

A. Not known to invade any natural habitats given at A2.3  
B. Known to occur in two or more of the habitats given at A2.3, with at least one a natural habitat.  
C. Known to occur in three or more of the habitats given at A2.3, with at least two a natural habitat.  
D. Known to occur in four or more of the habitats given at A2.3, with at least three a natural habitat.  
E. Known to occur in more than four of the habitats given at A2.3, with at least four a natural habitat.  
U. Unknown

Score 2

Documentation:
Identify type of habitats where it occurs and degree/type of impacts:
See A2.3.
Sources of information:  
Weldy & Werier, 2008; Brooklyn Botanic Garden, 2009.

#### 3.3. Role of disturbance in establishment

A. Requires anthropogenic disturbances to establish.  
B. May occasionally establish in undisturbed areas but can readily establish in areas with natural or anthropogenic disturbances.  
C. Can establish independent of any known natural or anthropogenic disturbances.  
U. Unknown

Score 2

Documentation:
Identify type of disturbance:
Usually establishes in areas with disturbance.
Sources of information:  
Tu, 2003; Lu, 2004; Symstad, 2004; author's (Moore's) pers. obs.

#### 3.4. Climate in native range

A. Native range does not include climates similar to New York  
B. Native range possibly includes climates similar to at least part of New York.  
C. Native range includes climates similar to those in New York  
U. Unknown

Score 3

Documentation:
Describe what part of the native range is similar in climate to New York:
Europe, Asia.
Sources of information:
Ball, 1968.

3.5. Current introduced distribution in the northeastern USA and eastern Canada (see question 3.1 for definition of geographic scope)

<table>
<thead>
<tr>
<th>Option</th>
<th>Score</th>
</tr>

<td>3</td>
</tr>
</tbody>
</table>
New York
Non-Native Plant Invasiveness Ranking Form

U. Unknown

Documentation:
Identify longevity of seed bank:
Seeds remain in soil for number of years; no evidence for longer than 10 years.
Sources of information:

Score 2

4.2. Vegetative regeneration
A. No regrowth following removal of aboveground growth 0
B. Regrowth from ground-level meristems 1
C. Regrowth from extensive underground system 2
D. Any plant part is a viable propagule 3
U. Unknown

Documentation:
Describe vegetative response:
Regrowth from underground rhizome system.
Sources of information:
Tu, 2003; Lu, 2004; author's (Moore's) pers. obs..

Score 2

4.3. Level of effort required
A. Management is not required: e.g., species does not persist without repeated anthropogenic disturbance. 0
B. Management is relatively easy and inexpensive: e.g. 10 or fewer person-hours of manual effort (pulling, cutting and/or digging) can eradicate a 1 acre infestation in 1 year (infestation averages 50% cover or 1 plant/100 ft²). 2
C. Management requires a major short-term investment: e.g. 100 or fewer person-hours/year of manual effort, or up to 10 person-hours/year using mechanical equipment (chain saws, mowers, etc.) for 2-5 years to suppress a 1 acre infestation. Eradication is difficult, but possible (infestation as above). 3
D. Management requires a major investment: e.g. more than 100 person-hours/year of manual effort, or more than 10 person hours/year using mechanical equipment, or the use of herbicide, grazing animals, fire, etc. for more than 5 years to suppress a 1 acre infestation. Eradication may be impossible (infestation as above). 4
U. Unknown

Documentation:
Identify types of control methods and time-term required:
Methods of control include grazing (except horses), burning, chemical (2,4-D, glyphosate, triclopyr, clopyralid) and mechanical removal. Stands require large time investments because they can be large and the resprouting from rhizomes and long-lived seeds require years of monitoring and re-removal.
Sources of information:

Score 4

Total Possible 10
Section Four Total 8

Total for 4 sections Possible 100
Total for 4 sections 54

C. STATUS OF CULTIVARS AND HYBRIDS:
At the present time (May 2008) there is no protocol or criteria for assessing the invasiveness of cultivars independent of the species to which they belong. Such a protocol is needed, and individuals with the appropriate expertise should address this issue in the future. Such a protocol will likely require data on cultivar fertility and identification in both experimental and natural settings.

Hybrids (crosses between different parent species) should be assessed individually and separately from the parent species wherever taxonomically possible, since their invasiveness may differ from that of the parent species. An exception should be made if the taxonomy of the species and hybrids are uncertain, and species and hybrids can not be clearly distinguished in the field. In such cases it is not feasible to distinguish species and hybrids, and they can only be assessed as a single unit.

Some cultivars of the species known to be available:
