NEW YORK
NON-NATIVE PLANT INVASIVENESS RANKING FORM

Documentation:
Sources of information:

A2.1. What is the likelihood that this species will occur and persist outside of cultivation, given the climate in the following PRISMs? (obtain from PRISM invasiveness ranking form)

Not Assessed  Adirondack Park Invasive Program
Not Assessed  Capital/Mohawk
Not Assessed  Catskill Regional Invasive Species Partnership
Not Assessed  Finger Lakes
Very Likely  Long Island Invasive Species Management Area
Not Assessed  Lower Hudson
Not Assessed  Saint Lawrence/Eastern Lake Ontario
Not Assessed  Western New York

Documentation:
Sources of information (e.g.: distribution models, literature, expert opinions):
Documented from the PRISM since the 1880s; suitability of habitats.
Lovett-Doust et al., 1990; Brooklyn Botanic Garden, 2009.

If the species does not occur and is not likely to occur with any of the PRISMs, then stop here as there is no need to assess the species.

A2.2. What is the current distribution of the species in each PRISM? (obtain rank from PRISM invasiveness ranking forms)

Distribution
Adirondack Park Invasive Program Not Assessed
Capital/Mohawk Not Assessed
Catskill Regional Invasive Species Partnership Not Assessed
Finger Lakes Not Assessed
Long Island Invasive Species Management Area Common
Lower Hudson Not Assessed
Saint Lawrence/Eastern Lake Ontario Not Assessed
Western New York Not Assessed

Documentation:
Sources of information:
Brooklyn Botanic Garden, 2009.

A2.3. Describe the potential or known suitable habitats within New York. Natural habitats include all habitats not under active human management. Managed habitats are indicated with an asterisk.

Aquatic Habitats  Wetland Habitats  Upland Habitats
☐ Salt/brackish waters ☒ Salt/brackish marshes ☒ Cultivated*
☐ Freshwater tidal ☒ Freshwater marshes ☐ Grasslands/old fields
☐ Rivers/streams ☐ Peatlands ☐ Shrublands
☐ Natural lakes and ponds ☐ Shrub swamps ☐ Forests/woodlands
☐ Vernal pools ☐ Forested wetlands/riparian ☐ Alpine
☐ Reservoirs/impoundments* ☐ Ditches* ☐ Roadsides*
☐ Salt/brackish marshes
☐ Freshwater marshes
☐ Peatlands
☐ Shrub swamps
☐ Forested wetlands/riparian
☐ Alpine
☐ Beaches and/or coastal dunes

Other potential or known suitable habitats within New York:
Lawn; marsh, pond and stream margins; wood margins and clearings.

Documentation:
Sources of information:
Author's personal observations; Lovett-Doust et al., 1990; Flora of North America Editorial Committee, 1997; He et al., 1999; Oliver, 2004; Brooklyn Botanic Garden, 2009.
## B. INVASIVENESS RANKING

Questions apply to areas similar in climate and habitats to New York unless specified otherwise.

### 1. ECOLOGICAL IMPACT

1.1. Impact on Natural Ecosystem Processes and System-Wide Parameters (e.g. fire regime, geomorphological changes (erosion, sedimentation rates), hydrologic regime, nutrient and mineral dynamics, light availability, salinity, pH)

<table>
<thead>
<tr>
<th>Score</th>
<th>Documentation:</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>No perceivable impact on ecosystem processes based on research studies, or the absence of impact information if a species is widespread (&gt;10 occurrences in minimally managed areas), has been well-studied (&gt;10 reports/publications), and has been present in the northeast for &gt;100 years.</td>
</tr>
<tr>
<td>3</td>
<td>Influences ecosystem processes to a minor degree (e.g., has a perceivable but mild influence on soil nutrient availability)</td>
</tr>
<tr>
<td>7</td>
<td>Significant alteration of ecosystem processes (e.g., increases sedimentation rates along streams or coastlines, reduces open water that are important to waterfowl)</td>
</tr>
<tr>
<td>10</td>
<td>Major, possibly irreversible, alteration or disruption of ecosystem processes (e.g., the species alters geomorphology and/or hydrology, affects fire frequency, alters soil pH, or fixes substantial levels of nitrogen in the soil making soil unlikely to support certain native plants or more likely to favor non-native species)</td>
</tr>
<tr>
<td>U</td>
<td>Unknown</td>
</tr>
</tbody>
</table>

### 1.2. Impact on Natural Community Structure

<table>
<thead>
<tr>
<th>Score</th>
<th>Documentation:</th>

<tbody>
<tr>
<td>0</td>
<td>No perceived impact; causes no apparent change in native populations</td>
</tr>
<tr>
<td>3</td>
<td>Influences community composition (e.g., reduces the number of individuals in one or more native species in the community)</td>
</tr>
<tr>
<td>7</td>
<td>Significantly alters community composition (e.g., produces a significant reduction in the</td>
</tr>
</tbody>
</table>
1.4. Impact on other species or species groups (cumulative impact of this species on the animals, fungi, microbes, and other organisms in the community it invades. Examples include reduction in nesting/foraging sites; reduction in habitat connectivity; injurious components such as spines, thorns, burrs, toxins; suppresses soil/sediment microflora; interferes with native pollinators and/or pollination of a native species; hybridizes with a native species; hosts a non-native disease which impacts a native species)

A. Negligible perceived impact 0
B. Minor impact 3
C. Moderate impact 7
D. Severe impact on other species or species groups 10
U. Unknown

Documentation:
Identify type of impact or alteration:
No studies on the impact on other species located.
Sources of information:
Oliver, 2004.

2. BIOLOGICAL CHARACTERISTICS AND DISPERSAL ABILITY

2.1. Mode and rate of reproduction (provisional thresholds, more investigation needed)

A. No reproduction by seeds or vegetative propagules (i.e. plant sterile with no sexual or asexual reproduction). 0
B. Limited reproduction (fewer than 10 viable seeds per plant AND no vegetative reproduction; if viability is not known, then maximum seed production is less than 100 seeds per plant and no vegetative reproduction) 1
C. Moderate reproduction (fewer than 100 viable seeds per plant - if viability is not known, then maximum seed production is less than 1000 seeds per plant - OR limited successful vegetative spread documented) 2
D. Abundant reproduction with vegetative asexual spread documented as one of the plants prime reproductive means OR more than 100 viable seeds per plant (if viability is not known, then maximum seed production reported to be greater than 1000 seeds per plant.) 4
U. Unknown

Documentation:
Describe key reproductive characteristics (including seeds per plant):
Can develop large spreading clonal mats via creeping stolons. European studies found have found up to 12,000 viable seeds per square meter.

Sources of information:
Lovett-Doust et al., 1990.

2.2. Innate potential for long-distance dispersal (e.g. bird dispersal, sticks to animal hair, buoyant fruits, pappus for wind-dispersal)

A. Does not occur (no long-distance dispersal mechanisms) 0
B. Infrequent or inefficient long-distance dispersal (occurs occasionally despite lack of adaptations) 1
C. Moderate opportunities for long-distance dispersal (adaptations exist for long-distance dispersal, but studies report that 95% of seeds land within 100 meters of the parent plant) 2
D. Numerous opportunities for long-distance dispersal (adaptations exist for long-distance dispersal and evidence that many seeds disperse greater than 100 meters from the parent plant) 4
U. Unknown

Score 4

Documentation:
Identify dispersal mechanisms:
Anemochory (wind dispersal), endozoochory (animal), epizoochory (animal), and hydrochory (water).

Sources of information:
Lovett-Doust et al., 1990; Oliver, 2004; Vogt et al., 2006.

2.3. Potential to be spread by human activities (both directly and indirectly – possible mechanisms include: commercial sales, use as forage/revegetation, spread along highways, transport on boats, contaminated compost, land and vegetation management equipment such as mowers and excavators, etc.)

A. Does not occur 0
B. Low (human dispersal to new areas occurs almost exclusively by direct means and is infrequent or inefficient) 1
C. Moderate (human dispersal to new areas occurs by direct and indirect means to a moderate extent) 2
D. High (opportunities for human dispersal to new areas by direct and indirect means are numerous, frequent, and successful) 3
U. Unknown

Score 1

Documentation:
Identify dispersal mechanisms:
Reportedly dispersed by humans and their vehicles. A handful of cultivars available on the internet.

Sources of information:
Author’s personal observations; Lovett-Doust et al., 1990

2.4. Characteristics that increase competitive advantage, such as shade tolerance, ability to grow on infertile soils, perennial habit, fast growth, nitrogen fixation, allelopathy, etc.

A. Possesses no characteristics that increase competitive advantage 0
B. Possesses one characteristic that increases competitive advantage 3
C. Possesses two or more characteristics that increase competitive advantage 6
U. Unknown

Score 6

Documentation:
Evidence of competitive ability:
Perennial; well adapted to a variety of substrate moisture regimes (including prolonged waterlogging and submergence- He et al., 1999), textures, and pH (Lovett-Doust et al., 1990; Silvertown et al., 2001; Lynn & Waldren, 2003).

Exhibits high vegetative plasticity seasonally (Hintikka, 1975) and in response to varying environmental conditions (Perovova & Gershunina, 1975; Lovett-Doust et al., 1990; Waite, 1994; He et al., 1999; van Kleunen & Fischer, 2001; Lynn & Waldren, 2001).

Also exhibits reproductive plasticity- one study found stands within less competitive environments invested more into sexual reproduction (measured as proportion of ramets that flowered), whereas stands in more competitive environments invested more into vegetative reproduction (Prtia & Schmid, 2000).

Possibly allelopathic (Lovett-Doust et al., 1990).

Sources of information:

2.5. Growth vigor
A. Does not form thickets or have a climbing or smothering growth habit 0
B. Has climbing or smothering growth habit, forms a dense layer above shorter vegetation, forms dense thickets, or forms a dense floating mat in aquatic systems where it smothers other vegetation or organisms 2
U. Unknown Score 0

Documentation:
Describe growth form:
While R. repens can develop large spreading clonal mats via creeping stolons; it does not form a smothering or climbing habit.
Sources of information:
author's personal observations; Lovett-Doust et al., 1990

2.6. Germination/Regeneration
A. Requires open soil or water and disturbance for seed germination, or regeneration from vegetative propagules. 0
B. Can germinate/regenerate in vegetated areas but in a narrow range or in special conditions 2
C. Can germinate/regenerate in existing vegetation in a wide range of conditions 3
U. Unknown (No studies have been completed) Score U

Documentation:
Describe germination requirements:
Germination enhanced by higher light and moisture, and temperature fluctuation regimes. One controlled study found germination rates approaching 90% (Thompson & Grime, 1983), but germination in the context of disturbance or vegetative competition was not addressed.
Sources of information:
Thompson & Grime, 1983; Lovett-Doust et al., 1990; Harris et al., 1998.

2.7. Other species in the genus invasive in New York or elsewhere
A. No 0
B. Yes 3
U. Unknown Score 3

Documentation:
Species:
Ranunculus ficaria is listed as invasive in New England. Ranunculus acris and R. bulbosus
3. ECOLOGICAL AMPLITUDE AND DISTRIBUTION

3.1. Density of stands in natural areas in the northeastern USA and eastern Canada (use same definition as Gleason & Cronquist which is: “The part of the United States covered extends from the Atlantic Ocean west to the western boundaries of Minnesota, Iowa, northern Missouri, and southern Illinois, south to the southern boundaries of Virginia, Kentucky, and Illinois, and south to the Missouri River in Missouri. In Canada the area covered includes Nova Scotia, Prince Edward Island, New Brunswick, and parts of Quebec and Ontario lying south of the 47th parallel of latitude”)

A. No large stands (no areas greater than 1/4 acre or 1000 square meters) 0
B. Large dense stands present in areas with numerous invasive species already present or disturbed landscapes 2
C. Large dense stands present in areas with few other invasive species present (i.e. ability to invade relatively pristine natural areas) 4
U. Unknown

Score 0

Documentation:
Identify reason for selection, or evidence of weedy history:
While moderate-sized stands have been observed in the area; no large stands have been observed or reported.
Sources of information:
Author’s personal observations; Oliver, 2004.

3.2. Number of habitats the species may invade

A. Not known to invade any natural habitats given at A2.3 0
B. Known to occur in two or more of the habitats given at A2.3, with at least one a natural habitat. 1
C. Known to occur in three or more of the habitats given at A2.3, with at least two a natural habitat. 2
D. Known to occur in four or more of the habitats given at A2.3, with at least three a natural habitat. 4
E. Known to occur in more than four of the habitats given at A2.3, with at least four a natural habitat. 6
U. Unknown

Score 6

Documentation:
Identify type of habitats where it occurs and degree/type of impacts:
See A2.3.
Sources of information:
Brooklyn Botanic Garden, 2009.

3.3. Role of disturbance in establishment

A. Requires anthropogenic disturbances to establish. 0
B. May occasionally establish in undisturbed areas but can readily establish in areas with natural or anthropogenic disturbances. 2
**NEW YORK**

**NON-NATIVE PLANT INVASIVENESS RANKING FORM**

| C. | Can establish independent of any known natural or anthropogenic disturbances. | 4 |
| U. | Unknown | | Score 2 |

**Documentation:**
Identify type of disturbance:
Usually found in disturbed habitats, recruitment of R. repens in established grassland or woodland communities is reportedly rare. One European study of old field succession found that R. repens accelerating in early succession, then peaking at mid succession (about 10-12 years), then declining in frequency as succession maturized (Huisman et al., 1993). Not known to require anthropogenic disturbance.
Sources of information: Lovett-Doust et al., 1990; Huisman et al., 1993.

3.4. Climate in native range

| A. | Native range does not include climates similar to New York | 0 |
| B. | Native range possibly includes climates similar to at least part of New York. | 1 |
| C. | Native range includes climates similar to those in New York | 3 |
| U. | Unknown | | Score 3 |

**Documentation:**
Describe what part of the native range is similar in climate to New York:
Europe, as far north as Norway.
Sources of information: Lovett-Doust et al., 1990

3.5. Current introduced distribution in the northeastern USA and eastern Canada (see question 3.1 for definition of geographic scope )

| A. | Not known from the northeastern US and adjacent Canada | 0 |
| B. | Present as a non-native in one northeastern USA state and/or eastern Canadian province. | 1 |
| C. | Present as a non-native in 2 or 3 northeastern USA states and/or eastern Canadian provinces. | 2 |
| D. | Present as a non-native in 4–8 northeastern USA states and/or eastern Canadian provinces, and/or categorized as a problem weed (e.g., “Noxious” or “Invasive”) in 1 northeastern state or eastern Canadian province. | 3 |
| E. | Present as a non-native in >8 northeastern USA states and/or eastern Canadian provinces, and/or categorized as a problem weed (e.g., “Noxious” or “Invasive”) in 2 northeastern states or eastern Canadian provinces. | 4 |
| U. | Unknown | | Score 4 |

**Documentation:**
Identify states and provinces invaded:
Reported from all northeastern states and provinces.
Sources of information: See known introduced range in plants.usda.gov, and update with information from states and Canadian provinces.

3.6. Current introduced distribution of the species in natural areas in the eight New York State PRISMs (Partnerships for Regional Invasive Species Management)

| A. | Present in none of the PRISMs | 0 |
| B. | Present in 1 PRISM | 1 |
| C. | Present in 2 PRISMs | 2 |
| D. | Present in 3 PRISMs | 3 |
**NEW YORK**

**NON-NATIVE PLANT INVASIVENESS RANKING FORM**

| E. | Present in more than 3 PRISMs or on the Federal noxious weed lists | 4 |
| U. | Unknown | Score | 4 |

**Documentation:**

Describe distribution:
All PRISMs; see A1.1.
Sources of information:

**Total Possible** 25
**Section Three Total** 19

---

**4. DIFFICULTY OF CONTROL**

4.1. Seed banks

| A. | Seeds (or vegetative propagules) remain viable in soil for less than 1 year, or does not make viable seeds or persistent propagules. | 0 |
| B. | Seeds (or vegetative propagules) remain viable in soil for at least 1 to 10 years | 2 |
| C. | Seeds (or vegetative propagules) remain viable in soil for more than 10 years | 3 |
| U. | Unknown | Score | 2 |

**Documentation:**

Identify longevity of seed bank:
Demonstrated to seed bank- one study (Roberts & Boddrell, 1985) found a viable seed bank for at least 5 years. No evidence for more than 10 years.
Sources of information:

4.2. Vegetative regeneration

| A. | No regrowth following removal of aboveground growth | 0 |
| B. | Regrowth from ground-level meristems | 1 |
| C. | Regrowth from extensive underground system | 2 |
| D. | Any plant part is a viable propagule | 3 |
| U. | Unknown | Score | 2 |

**Documentation:**

Describe vegetative response:
Readily regenerates from roots and root fragments.
Sources of information:
Lovett-Doust et al., 1990.

4.3. Level of effort required

| A. | Management is not required: e.g., species does not persist without repeated anthropogenic disturbance. | 0 |
| B. | Management is relatively easy and inexpensive: e.g. 10 or fewer person-hours of manual effort (pulling, cutting and/or digging) can eradicate a 1 acre infestation in 1 year (infestation averages 50% cover or 1 plant/100 ft²). | 2 |
| C. | Management requires a major short-term investment: e.g. 100 or fewer person-hours/year of manual effort, or up to 10 person-hours/year using mechanical equipment (chain saws, mowers, etc.) for 2-5 years to suppress a 1 acre infestation. Eradication is difficult, but possible (infestation as above). | 3 |
| D. | Management requires a major investment: e.g. more than 100 person-hours/year of manual | 4 |
effort, or more than 10 person hours/year using mechanical equipment, or the use of herbicide, grazing animals, fire, etc. for more than 5 years to suppress a 1 acre infestation. Eradication may be impossible (infestation as above).

U. Unknown

Documentation:
Identify types of control methods and time-term required:
No studies addressing time commitment located. While species is not reported to grow in large patches (over 0.25 acre), it can form monoculture patches that may warrant control. Species occurs in wetlands where management would be more difficult. Specific protocols given below.

Chemical: 2,4-D, MCPA, Dicamba, Napropamide, Napropamide/pendimethalin mixture, Tramat (ethofumesate), propyzamide, MCPA-salt, Mecoprop, mecoprop salt, and dichlorprop-salt reported to work in controlling R. repens (Lovett-Doust et al., 1990; Dixon & Clay, 2004.; Dixon et al., 2006).

Mechanical: Ineffective- one study found cutting two times annually increased frequency of R. repens (Parr & Way, 1988).

Biocontrol: Various natural insect and microorganismic enemies of R. repens have been identified, but no biocontrol have yet been developed (Lovett-Doust et al., 1990).

Sources of information:

C. STATUS OF CULTIVARS AND HYBRIDS:

At the present time (May 2008) there is no protocol or criteria for assessing the invasiveness of cultivars independent of the species to which they belong. Such a protocol is needed, and individuals with the appropriate expertise should address this issue in the future. Such a protocol will likely require data on cultivar fertility and identification in both experimental and natural settings.

Hybrids (crosses between different parent species) should be assessed individually and separately from the parent species wherever taxonomically possible, since their invasiveness may differ from that of the parent species. An exception should be made if the taxonomy of the species and hybrids are uncertain, and species and hybrids can not be clearly distinguished in the field. In such cases it is not feasible to distinguish species and hybrids, and they can only be assessed as a single unit.

Some cultivars of the species known to be available: 'Buttered Popcorn', 'Flore Pleno' ('Pleniflorus'), 'Timothy Clark'
