B. INVASIVENESS RANKING

Questions apply to areas similar in climate and habitats to New York unless specified otherwise.

1. ECOLOGICAL IMPACT

regime	pact on Natural Ecosystem Processes and System-Wide Parameters (e.g. fire, geomorphological changes (erosion, sedimentation rates), hydrologic regime,	
nutrien A.	t and mineral dynamics, light availability, salinity, pH) No perceivable impact on ecosystem processes based on research studies, or the absence of impact information if a species is widespread (>10 occurrences in minimally managed areas), has been well-studied (>10 reports/publications), and has been present in the northeast for >100 years.	0
B.	Influences ecosystem processes to a minor degree (e.g., has a perceivable but mild influence on soil nutrient availability)	3
C.	Significant alteration of ecosystem processes (e.g., increases sedimentation rates along streams or coastlines, reduces open water that are important to waterfowl)	7
D.	Major, possibly irreversible, alteration or disruption of ecosystem processes (e.g., the species alters geomorphology and/or hydrology, affects fire frequency, alters soil pH, or fixes substantial levels of nitrogen in the soil making soil unlikely to support certain native plants or more likely to favor non-native species)	10
U.	Unknown Score	U
	Documentation:	
	Identify ecosystem processes impacted (or if applicable, justify choosing answer A in the absence of impact information) No studies known on impacts of Festuca filiformis to natural ecosystem processes or	
	system-wide parameters. Sources of information: Author's pers. comm.	
1.2. Im	pact on Natural Community Structure	
A.	No perceived impact; establishes in an existing layer without influencing its structure	0
В.	Influences structure in one layer (e.g., changes the density of one layer)	3
C.	Significant impact in at least one layer (e.g., creation of a new layer or elimination of an existing layer)	7
D.	Major alteration of structure (e.g., covers canopy, eradicating most or all layers below)	10
U.	Unknown	
	Score	3
	Documentation: Identify type of impact or alteration: Species can increase density in the herb layer. Further evidence of creation of large turfs in natural areas would warrant re-evaluation for significant impacts to community structure. Sources of information: Author's pers. obs.	
1.3. Im	pact on Natural Community Composition	
A.	No perceived impact; causes no apparent change in native populations	0
В.	Influences community composition (e.g., reduces the number of individuals in one or more native species in the community)	3
C.	Significantly alters community composition (e.g., produces a significant reduction in the population size of one or more native species in the community)	7
D.	Causes major alteration in community composition (e.g., results in the extirpation of one or several native species, reducing biodiversity or change the community composition towards species exotic to the natural community)	10
U.	Unknown	

	S	core	3
	Documentation:		
	Identify type of impact or alteration:

2. B	IOLOGICAL CHARACTERISTICS AND DISPERSAL ABILITY		
2.1. Mo	ode and rate of reproduction		
A.	No reproduction by seeds or vegetative propagules (i.e. plant sterile with no sexual or		0
	asexual reproduction).		
В.	Limited reproduction (fewer than 10 viable seeds per plant AND no vegetative		1
	reproduction; if viability is not known, then maximum seed production is less than 100		
~	seeds per plant and no vegetative reproduction)		•
C.	Moderate reproduction (fewer than 100 viable seeds per plant - if viability is not known,		2
	then maximum seed production is less than 1000 seeds per plant - OR limited successful vegetative spread documented)		
D.	Abundant reproduction with vegetative asexual spread documented as one of the plants		4
D.	prime reproductive means OR more than 100 viable seeds per plant (if viability is not		7
	known, then maximum seed production reported to be greater than 1000 seeds per plant.	.)	
U.	Unknown	,	
- 1	S	core	2
	Documentation:		
	Describe key reproductive characteristics (including seeds per plant):		
	Species is cespitose, with individual clumps producing hundreds of seeds. Viability of se	eed	
	unknown.		
	Sources of information:		

	Darbyshire & Pavlick, 2007.		
2.2. Inn	nate potential for long-distance dispersal (e.g. bird dispersal, sticks to animal	hair,	
	fruits, pappus for wind-dispersal)	,	
A.	Does not occur (no long-distance dispersal mechanisms)		0
B.	Infrequent or inefficient long-distance dispersal (occurs occasionally despite lack of adaptations)		1
C.	Moderate opportunities for long-distance dispersal (adaptations exist for long-distance dispersal, but studies report that 95% of seeds land within 100 meters of the parent pla		2
D.	Numerous opportunities for long-distance dispersal (adaptations exist for long-distance dispersal and evidence that many seeds disperse greater than 100 meters from the pare plant)		4
U.	Unknown		
		Score	4
	Documentation:		
	Identify dispersal mechanisms:		
	Grains are small and presumably readily transported externally by animals (epizoocho wind (anemochory). Gucker reports wind dispersal for another Festuca species (Festuca rizonica).		
	Sources of information: Gucker, 2006; author's pers. obs.		
2.3 Pot	tential to be spread by human activities (both directly and indirectly – pos	sible	
	nisms include: commercial sales, use as forage/revegetation, spread along		
	sys, transport on boats, contaminated compost, land and vegetation		
_	ement equipment such as mowers and excavators, etc.)		
A.	Does not occur		0
В.	Low (human dispersal to new areas occurs almost exclusively by direct means and is infrequent or inefficient)		1
C.	Moderate (human dispersal to new areas occurs by direct and indirect means to a mode extent)	erate	2
D.	High (opportunities for human dispersal to new areas by direct and indirect means are numerous, frequent, and successful)		3
U.	Unknown		
		Score	3
	Documentation:		
	Identify dispersal mechanisms:		
	Planted for turf; seeds readily spread by mowing equipment. Sources of information:		
	Darbyshire & Pavlick, 2007; author's pers. obs.		
2.4. Ch	aracteristics that increase competitive advantage, such as shade tolerance,	,	
ability 1	to grow on infertile soils, perennial habit, fast growth, nitrogen fixation,		
allelopa	athy, etc.		
A.	Possesses no characteristics that increase competitive advantage		0
B.	Possesses one characteristic that increases competitive advantage		3
C.	Possesses two or more characteristics that increase competitive advantage		6
U.	Unknown		
		Score	6
	Documentation:		
	Evidence of competitive ability:		
	Perennial, can grow on poor soils. Sources of information:		

		Darbyshire & Pavlick, 2007; author's pers. obs.	
		owth vigor	_
	A.	Does not form thickets or have a climbing or smothering growth habit	0
	В.	Has climbing or smothering growth habit, forms a dense layer above shorter vegetation, forms dense thickets, or forms a dense floating mat in aquatic systems where it smothers other vegetation or organisms Unknown	2
	U.		. 0
		Scor	e 0
		Documentation: Describe growth form: Not reported to form thickets or possess a climbing or smothering habit. Sources of information: Author's pers. obs.	
2.6.	Ger	mination/Regeneration	
	A.	Requires open soil or water and disturbance for seed germination, or regeneration from	0
	В.	vegetative propagules. Can germinate/regenerate in vegetated areas but in a narrow range or in special conditions	2
	Б. С.	Can germinate/regenerate in existing vegetation in a wide range of conditions	3

C. STATUS OF CULTIVARS AND HYBRIDS:

At the present time (May 2008) there is no protocol or criteria for assessing the invasiveness of cultivars independent of the species to which they belong. Such a protocol is needed, and individuals with the appropriate expertise should address this issue in the future. Such a protocol will likely require data on cultivar fertility and identification in both experimental and natural settings.

Hybrids (crosses between different parent species) should be assessed individually and separately from the parent species wherever taxonomically possible, since their invasiveness may differ from that of the parent species. An exception should be made if the taxonomy of the species and hybrids are uncertain, and species and hybrids can not be clearly distinguished in the field. In such cases it is not feasible to distinguish species and hybrids, and they can only be assessed as a single unit.

Some cultivars of the species known to be available: 'glauca', 'silver lining' 'sea urchin', 'elijah blue'.
