Scientific name: Viburnum lantana L.  
USDA Plants Code: VILA

Common names: Wayfaring-tree

Native distribution: Eurasia

Date assessed: January 6, 2010

Assessors: Steve Glenn, Gerry Moore

Reviewers: LIISMA SRC

Date Approved: Jan. 20, 2010

Form version date: 10 July 2009

New York Invasiveness Rank: Moderate (Relative Maximum Score 50.00-69.99)

</tbody>
</table>

Relative maximum score\(^\d\): 53.75

New York Invasiveness Rank\(^\d\): Moderate (Relative Maximum Score 50.00-69.99)

* For questions answered “unknown” do not include point value in “Total Answered Points Possible.” If “Total Answered Points Possible” is less than 70.00 points, then the overall invasive rank should be listed as “Unknown.”

†Calculated as 100(a/b) to two decimal places.

§Very High >80.00; High 70.00–80.00; Moderate 50.00–69.99; Low 40.00–49.99; Insignificant <40.00

Not Assessable: not persistent in NY, or not found outside of cultivation.

### A. DISTRIBUTION (KNOWN/POTENTIAL): Summarized from individual PRISM forms

A1.1. Has this species been documented to persist without cultivation in NY? (reliable source; voucher not required)

☒ Yes – continue to A1.2
☐ No – continue to A2.1

A1.2. In which PRISMs is it known (see inset map)?

☒ Adirondack Park Invasive Program
☒ Capital/Mohawk
☒ Catskill Regional Invasive Species Partnership
☒ Finger Lakes
☒ Long Island Invasive Species Management Area
☒ Lower Hudson
☒ Saint Lawrence/Eastern Lake Ontario
☒ Western New York
NEW YORK
NON-NATIVE PLANT INVASIVENESS RANKING FORM

A2.3. Describe the potential or known suitable habitats within New York. Natural habitats include all habitats not under active human management. Managed habitats are indicated with an asterisk.

Aquatic Habitats
- Salt/brackish waters
- Freshwater tidal
- Rivers/streams
- Natural lakes and ponds
- Vernal pools
- Reservoirs/impoundments

Wetland Habitats
- Salt/brackish marshes
- Freshwater marshes
- Peatlands
- Shrub swamps
- Forested wetlands/riparian
- Ditches
- Beaches and/or coastal dunes

Upland Habitats
- Cultivated
- Grasslands/old fields
- Shrublands
- Forests/woodlands
- Alpine
- Roadsides

Other potential or known suitable habitats within New York: hedges

## Non-Native Plant Invasiveness Ranking Form

### B. Invasiveness Ranking

Questions apply to areas similar in climate and habitats to New York unless specified otherwise.

#### 1. Ecological Impact

1.1. Impact on Natural Ecosystem Processes and System-Wide Parameters (e.g., fire regime, geomorphological changes (erosion, sedimentation rates), hydrologic regime, nutrient and mineral dynamics, light availability, salinity, pH)

<table>
<thead>
<tr>
<th>Score</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>No perceivable impact on ecosystem processes based on research studies, or the absence of impact information if a species is widespread (&gt;10 occurrences in minimally managed areas), has been well-studied (&gt;10 reports/publications), and has been present in the northeast for &gt;100 years.</td>
</tr>
<tr>
<td>3</td>
<td>Influences ecosystem processes to a minor degree (e.g., has a perceivable but mild influence on soil nutrient availability)</td>
</tr>
<tr>
<td>7</td>
<td>Significant alteration of ecosystem processes (e.g., increases sedimentation rates along streams or coastlines, reduces open water that are important to waterfowl)</td>
</tr>
<tr>
<td>10</td>
<td>Major, possibly irreversible, alteration or disruption of ecosystem processes (e.g., the species alters geomorphology and/or hydrology, affects fire frequency, alters soil pH, or fixes substantial levels of nitrogen in the soil making soil unlikely to support certain native plants or more likely to favor non-native species)</td>
</tr>
<tr>
<td>U</td>
<td>Unknown</td>
</tr>
</tbody>
</table>

**Documentation:**

Identify ecosystem processes impacted (or if applicable, justify choosing answer A in the absence of impact information)

No studies on the impact to ecosystem processes located.

**Sources of information:**

Authors' pers. comm.

1.2. Impact on Natural Community Structure

<table>
<thead>
<tr>
<th>Score</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>No perceived impact; establishes in an existing layer without influencing its structure</td>
</tr>
<tr>
<td>3</td>
<td>Influences structure in one layer (e.g., changes the density of one layer)</td>
</tr>
<tr>
<td>7</td>
<td>Significant impact in at least one layer (e.g., creation of a new layer or elimination of an existing layer)</td>
</tr>
<tr>
<td>10</td>
<td>Major alteration of structure (e.g., covers canopy, eradicate most or all layers below)</td>
</tr>
<tr>
<td>U</td>
<td>Unknown</td>
</tr>
</tbody>
</table>

**Documentation:**

Identify type of impact or alteration:

Can increase the density of the shrub layer. No published evidence or observations that the species causes significant impact or major alteration of structure.

**Sources of information:**

Authors' pers. obs.

1.3. Impact on Natural Community Composition

<table>
<thead>
<tr>
<th>Score</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>No perceived impact; causes no apparent change in native populations</td>
</tr>
<tr>
<td>3</td>
<td>Influences community composition (e.g., reduces the number of individuals in one or more native species in the community)</td>
</tr>
<tr>
<td>7</td>
<td>Significantly alters community composition (e.g., produces a significant reduction in the population size of one or more native species in the community)</td>
</tr>
<tr>
<td>10</td>
<td>Causes major alteration in community composition (e.g., results in the extirpation of one or several native species, reducing biodiversity or change the community composition towards species exotic to the natural community)</td>
</tr>
<tr>
<td>U</td>
<td>Unknown</td>
</tr>
</tbody>
</table>

**Documentation:**

Identify type of impact or alteration:

**Add documentation details here**

**Sources of information:**

Authors' pers. comm.
## Documentation:
Identify type of impact or alteration:
Species noted to influence community structure by reducing the number of individuals of native species in a community. Listed as potentially threatening to Wisconsin's native habitats (Hoffman & Kearns, 1997); no other studies on the impact to community composition located.
Sources of information:
Hoffman & Kearns, 1997; authors' pers. comm.

### 1.4. Impact on other species or species groups

cumulative impact of this species on the animals, fungi, microbes, and other organisms in the community it invades. Examples include reduction in nesting/foraging sites; reduction in habitat connectivity; injurious components such as spines, thorns, burrs, toxins; suppresses soil/sediment microflora; interferes with native pollinators and/or pollination of a native species; hybridizes with a native species; hosts a non-native disease which impacts a native species)

<table>

<td>B. Limited reproduction (fewer than 10 viable seeds per plant AND no vegetative reproduction; if viability is not known, then maximum seed production is less than 100 seeds per plant and no vegetative reproduction)</td>
<td>1</td>
</tr>
<tr>
<td>C. Moderate reproduction (fewer than 100 viable seeds per plant - if viability is not known, then maximum seed production is less than 1000 seeds per plant - OR limited successful vegetative spread documented)</td>
<td>2</td>
</tr>
<tr>
<td>D. Abundant reproduction with vegetative asexual spread documented as one of the plants prime reproductive means OR more than 100 viable seeds per plant (if viability is not known, then maximum seed production reported to be greater than 1000 seeds per plant.)</td>
<td>4</td>
</tr>
<tr>
<td>U. Unknown</td>
<td></td>
</tr>
</tbody>
</table>

**Score**

2

### Documentation:
Describe key reproductive characteristics (including seeds per plant):
Anecdotal web site information state that fruits can be profusely borne and attractive, but are often sparse or non-existent, as several shrubs are apparently needed in close proximity for cross-pollination and reliable fruit set, and fruit set is often poor to non-existent. However Kollmann & Grubb (2002) state that selfing is possible with 15-30 fruits per infrutescence and seeds 100% viable (Kollmann et al., 1998).
2.2. Innate potential for long-distance dispersal (e.g. bird dispersal, sticks to animal hair, buoyant fruits, pappus for wind-dispersal)

A. Does not occur (no long-distance dispersal mechanisms) 0
B. Infrequent or inefficient long-distance dispersal (occurs occasionally despite lack of adaptations) 1
C. Moderate opportunities for long-distance dispersal (adaptations exist for long-distance dispersal, but studies report that 95% of seeds land within 100 meters of the parent plant) 2
D. Numerous opportunities for long-distance dispersal (adaptations exist for long-distance dispersal and evidence that many seeds disperse greater than 100 meters from the parent plant) 4
U. Unknown

Score 4

Documentation:
Identify dispersal mechanisms:
Bird and mammal dispersed (endozoochory).
Sources of information:

2.3. Potential to be spread by human activities (both directly and indirectly – possible mechanisms include: commercial sales, use as forage/revegetation, spread along highways, transport on boats, contaminated compost, land and vegetation management equipment such as mowers and excavators, etc.)

A. Does not occur 0
B. Low (human dispersal to new areas occurs almost exclusively by direct means and is infrequent or inefficient) 1
C. Moderate (human dispersal to new areas occurs by direct and indirect means to a moderate extent) 2
D. High (opportunities for human dispersal to new areas by direct and indirect means are numerous, frequent, and successful) 3
U. Unknown

Score 3

Documentation:
Identify dispersal mechanisms:
Cultivated; for sale on numerous web sites; possible indirect transport through yard waste.
Sources of information:
Grier & Grier. 1929; authors' pers. obs.

2.4. Characteristics that increase competitive advantage, such as shade tolerance, ability to grow on infertile soils, perennial habit, fast growth, nitrogen fixation, allelopathy, etc.

A. Possesses no characteristics that increase competitive advantage 0
B. Possesses one characteristic that increases competitive advantage 3
C. Possesses two or more characteristics that increase competitive advantage 6
U. Unknown

Score 6

Documentation:
Evidence of competitive ability:
Perennial, shade tolerant, semi-evergreen (deciduous as an adult, tending to be evergreen when juvenile, Kollmann & Grubb, 2002) shrub. Seedlings reported tolerate of deep shade (Grubb et al., 1996), but more light might be required for further growth (Kollmann &
Grubb, 2002). Reportedly adaptable to dry to wet soils (Lee et al., 1991), including soils liable to drying in the summer, but which suffer a degree of water logging in the spring (Kollmann & Grubb, 2002). One water potential investigation (Hinckley et al., 1992) suggested that V. lantana would do poorly on drought sites- the investigators hypothesized “the competitive advantage must therefore depend on successful tolerance, not on avoidance of a drought-induced reduction in photosynthesis. We can only speculate upon the mechanisms in involved in this tolerance. One factor might be found in the lower carbohydrate requirements for the development and metabolic maintenance of the restricted root system of this species.” Reported to tolerate soils of various pH (usually pH 5-7>, Kollmann & Grubb, 2002), although one European study found V. lantana displayed lime-chlorosis (Grime & Hutchinson, 1967). Another study found high salt levels inhibited new growth (Thompson & Rutter, 1986). One study found V. lantana highly unpalatable to deer and rabbits (Kollmann & Grubb, 2002).

Sources of information:

2.5. Growth vigor
A. Does not form thickets or have a climbing or smothering growth habit 0
B. Has climbing or smothering growth habit, forms a dense layer above shorter vegetation, forms dense thickets, or forms a dense floating mat in aquatic systems where it smothers other vegetation or organisms 2
U. Unknown

Documentation:
Describe growth form:
No reports or observations of V. lanatana forming thickets or having a climbing or smothering habit in North America.
Sources of information:
Authors’ pers. comm., obs.

2.6. Germination/Regeneration
A. Requires open soil or water and disturbance for seed germination, or regeneration from vegetative propagules 0
B. Can germinate/regenerate in vegetated areas but in a narrow range or in special conditions 2
C. Can germinate/regenerate in existing vegetation in a wide range of conditions 3
U. Unknown (No studies have been completed)

Documentation:
Describe germination requirements:
Viburnum seed is slow to germinate and most species have embryo dormancy as well as seedling (epicotyl) dormancy and hard seed coats (Giersbach, 1937); stratification required. Seed reportedly viable for less than 2 years (Kollmann & Grubb, 2002). One controlled experiment found germination rates as high as 65% (Adams, 1927), and Kollmann et al. (1998) found seeds 100% viable. Not known to germinate in a wide range of conditions.

Sources of information:
Giersbach, 1937; Kollmann et al., 1998; Kollmann & Grubb, 2002; Dirr, 2007; authors’ pers. obs.

2.7. Other species in the genus invasive in New York or elsewhere
A. No 0
B. Yes 3
U. Unknown

Score 0
NEW YORK
NON-NATIVE PLANT INVASIVENESS RANKING FORM

Documentation:
Species:
V. dilatatum, V. opulus var. opulus, V. plicatum, V. rhytidophyllum, V. setigerum, V. sieboldii reported from the NY-NJ-CT area; none tracked as invasive.

Total Possible 25
Section Two Total 17

3. ECOLOGICAL AMPLITUDE AND DISTRIBUTION
3.1. Density of stands in natural areas in the northeastern USA and eastern Canada (use same definition as Gleason & Cronquist which is: “The part of the United States covered extends from the Atlantic Ocean west to the western boundaries of Minnesota, Iowa, northern Missouri, and southern Illinois, south to the southern boundaries of Virginia, Kentucky, and Illinois, and south to the Missouri River in Missouri. In Canada the area covered includes Nova Scotia, Prince Edward Island, New Brunswick, and parts of Quebec and Ontario lying south of the 47th parallel of latitude”)

A. No large stands (no areas greater than 1/4 acre or 1000 square meters) 0
B. Large dense stands present in areas with numerous invasive species already present or disturbed landscapes 2
C. Large dense stands present in areas with few other invasive species present (i.e. ability to invade relatively pristine natural areas) 4
U. Unknown 4

Documentation:
Identify reason for selection, or evidence of weedy history:
Reportedly rarely becoming locally dominant even in its native range; no reports of large stands in the Northeast located in literature or observed.
Sources of information:
Kollmann & Grubb, 2002.

Score 0

3.2. Number of habitats the species may invade
A. Not known to invade any natural habitats given at A2.3 0
B. Known to occur in one natural habitat given at A2.3 1
C. Known to occur in two natural habitats given at A2.3 2
D. Known to occur in three natural habitat given at A2.3 4
E. Known to occur in four or more natural habitats given at A2.3 6
U. Unknown 6

Documentation:
Identify type of habitats where it occurs and degree/type of impacts:
See A2.3.
Sources of information:
Schnitzler et al., 1992; Kollmann & Grubb, 2002; Brooklyn Botanic Garden, 2010.

Score 4

3.3. Role of disturbance in establishment
A. Requires anthropogenic disturbances to establish. 0
B. May occasionally establish in undisturbed areas but can readily establish in areas with natural or anthropogenic disturbances. 2
C. Can establish independent of any known natural or anthropogenic disturbances. 4
U. Unknown

Score: 2

**Documentation:**
Identify type of disturbance:
Readily establishes in disturbed areas; not known to require anthropogenic disturbance.
Sources of information:
Authors' pers. obs.

3.4. Climate in native range
A. Native range does not include climates similar to New York
B. Native range possibly includes climates similar to at least part of New York.
C. Native range includes climates similar to those in New York
U. Unknown

Score: 3

**Documentation:**
Describe what part of the native range is similar in climate to New York:
Ukraine, Caucasus Mountains, northern Turkey, and reportedly naturalized in southern Sweden.
Sources of information:
Kollmann & Grubb, 2002.

3.5. Current introduced distribution in the northeastern USA and eastern Canada (see question 3.1 for definition of geographic scope)
A. Not known from the northeastern US and adjacent Canada
B. Present as a non-native in one northeastern USA state and/or eastern Canadian province.
C. Present as a non-native in 2 or 3 northeastern USA states and/or eastern Canadian provinces.
D. Present as a non-native in 4–8 northeastern USA states and/or eastern Canadian provinces, and/or categorized as a problem weed (e.g., “Noxious” or “Invasive”) in 1 northeastern state or eastern Canadian province.
E. Present as a non-native in >8 northeastern USA states and/or eastern Canadian provinces, and/or categorized as a problem weed (e.g., “Noxious” or “Invasive”) in 2 northeastern states or eastern Canadian provinces.
U. Unknown

Score: 4

**Documentation:**
Identify states and provinces invaded:
CT, IA, IL, IN, MA, MD, ME, MI, NJ, NY, OH, PA, VT, WI; New Brunswick, Ontario, Quebec.
Sources of information: See known introduced range in plants.usda.gov, and update with information from states and Canadian provinces.

3.6. Current introduced distribution of the species in natural areas in the eight New York State PRISMs (Partnerships for Regional Invasive Species Management)
A. Present in none of the PRISMs
B. Present in 1 PRISM
C. Present in 2 PRISMs
D. Present in 3 PRISMs
E. Present in more than 3 PRISMs or on the Federal noxious weed lists
U. Unknown

Score: 4

**NEW YORK**

**NON-NATIVE PLANT INVASIVENESS RANKING FORM**

Documentation:
Identify types of control methods and time-term required:
Management is not currently known to be required in New York state. Listed as potentially threatening to Wisconsin's native habitats (Hoffman & Kearns, 1997), presently not listed as invasive elsewhere including the Northeast (Mehrhoff et al., 2003). No management studies located. BioControl: Numerous phytophagous insects reported from its native range (Kollmann & Grubb, 2002); with the European Pyrrhalta viburni becoming established in North America on viburnums (Hoebeke & Wheeler, 1983). The following recommendations are given for V. opulus and may be applicable to V. dilatatum: Hand-pull plants less than 3 feet tall, before the root system becomes established. Taller shrubs should be cut at ground level. Natural area managers recommend applying a 20% solution of glyphosate herbicide to the cut stump to avoid resprouting, and chipping the brush to prevent seed dispersal (Brooklyn Botanic Garden, 1996).

**C. STATUS OF CULTIVARS AND HYBRIDS:**

At the present time (May 2008) there is no protocol or criteria for assessing the invasiveness of cultivars independent of the species to which they belong. Such a protocol is needed, and individuals with the appropriate expertise should address this issue in the future. Such a protocol will likely require data on cultivar fertility and identification in both experimental and natural settings.

Hybrids (crosses between different parent species) should be assessed individually and separately from the parent species wherever taxonomically possible, since their invasiveness may differ from that of the parent species. An exception should be made if the taxonomy of the species and hybrids are uncertain, and species and hybrids can not be clearly distinguished in the field. In such cases it is not feasible to distinguish species and hybrids, and they can only be assessed as a single unit.

Some cultivars of the species known to be available: 'Aureum', 'Emerald Triumph', 'Macrophyllum', 'Mohican', 'Rugosum', 'Variegatum', 'Varifolium', 'Versicolor'
