New York
NON-NATIVE PLANT INVASIVENESS RANKING FORM

Scientific name: Paulownia tomentosa
Common names: Princess-Tree
Native distribution: China
Date assessed: 8/12/2008
Assessors: Steve Clemants, Gerry Moore
Reviewers: LIISMA SRC
Date Approved: 2008-08-20

New York Invasiveness Rank: Moderate (Relative Maximum Score 50.00-69.99)

\* For questions answered “unknown” do not include point value in “Total Answered Points Possible.” If “Total Answered Points Possible” is less than 70.00 points, then the overall invasive rank should be listed as “Unknown.”

\(^{†}\)Calculated as 100(a/b) to two decimal places.

\(^{§}\)Very High >80.00; High 70.00–80.00; Moderate 50.00–69.99; Low 40.00–49.99; Insignificant <40.00

A. DISTRIBUTION (KNOWN/POTENTIAL): Summarized from individual PRISM forms

- A1.1. Has this species ever been collected or documented in New York? (reliable source; voucher not required)
  - Yes – continue to A1.2
  - No – continue to A2.1

- A1.2. In which PRISMs is it known (see inset map)?
  - Adirondack Park Invasive Program
  - Capital/Mohawk
  - Catskill Regional Invasive Species Partnership
  - Finger Lakes
  - Long Island Invasive Species Management Area
  - Lower Hudson
  - Saint Lawrence/Eastern Lake Ontario
NEW YORK
NON-NATIVE PLANT INVASIVENESS RANKING FORM

[Western New York]

Documentation:
Sources of information:

A2.1. What is the likelihood that this species will occur and persist given the climate in the following PRISMs? (obtain from PRISM invasiveness ranking form)

| Not Assessed | Adirondack Park Invasive Program |
| Not Assessed | Capital/Mohawk |
| Not Assessed | Catskill Regional Invasive Species Partnership |
| Not Assessed | Finger Lakes |
| Very Likely | Long Island Invasive Species Management Area |
| Not Assessed | Lower Hudson |
| Not Assessed | Saint Lawrence/Eastern Lake Ontario |
| Not Assessed | Western New York |

Documentation:
Sources of information (e.g.: distribution models, literature, expert opinions):

*If the species does not occur and is not likely to occur with any of the PRISMs, then stop here as there is no need to assess the species.*

A2.2. What is the current distribution of the species in each PRISM? (obtain rank from PRISM invasiveness ranking forms)

| Distribution |
| Adirondack Park Invasive Program Not Assessed |
| Capital/Mohawk Not Assessed |
| Catskill Regional Invasive Species Partnership Not Assessed |
| Finger Lakes Not Assessed |
| Long Island Invasive Species Management Area Widespread |
| Lower Hudson Not Assessed |
| Saint Lawrence/Eastern Lake Ontario Not Assessed |
| Western New York Not Assessed |

Documentation:
Sources of information:

A2.3. Describe the potential or known suitable habitats within New York. Natural habitats include all habitats not under active human management. Managed habitats are indicated with an asterisk.

Aquatic Habitats
- Salt/brackish waters
- Freshwater tidal
- Rivers/streams
- Natural lakes and ponds
- Vernal pools
- Reservoirs/impoundments*

Wetland Habitats
- Salt/brackish marshes
- Freshwater marshes
- Peatlands
- Shrub swamps
- Forested wetlands/riparian
- Ditches*
- Beaches and/or coastal dunes

Upland Habitats
- Cultivated*
- Grasslands/old fields
- Shrublands
- Forests/woodlands
- Alpine
- Roadsides*

Other potential or known suitable habitats within New York:
Cliffs, vacant lots.

Documentation:

Mehrhoff et al., 2004, Maybury, 2005; Brooklyn Botanic Garden, 2008.
**B. INVASIVENESS RANKING**

1. **ECOLOGICAL IMPACT**

1.1. Impact on Natural Ecosystem Processes and System-Wide Parameters (e.g. fire regime, geomorphological changes (erosion, sedimentation rates), hydrologic regime, nutrient and mineral dynamics, light availability, salinity, pH)

   A. No perceivable impact on ecosystem processes based on research studies, or the absence of impact information if a species is widespread (>10 occurrences in minimally managed areas), has been well-studied (>10 reports/publications), and has been present in the northeast for >100 years.  
   
   Score: 0

   Documentation:
   Identify ecosystem processes impacted (or if applicable, justify choosing answer A in the absence of impact information)
   Maybury inferred no impacts. Species is widespread has been well studied (see references below and within Maybury, 2005), and present in northeast for over 100 years.

   Sources of information:
   Maybury, 2004 and references therein.

   B. Influences ecosystem processes to a minor degree (e.g., has a perceivable but mild influence on soil nutrient availability)

   Score: 3

   Documentation:
   Grows very quickly in disturbed sites and altering the density of the layer in which it occurs.

   Sources of information:
   Maybury, 2005.

   C. Significant alteration of ecosystem processes (e.g., increases sedimentation rates along streams or coastlines, reduces open water that are important to waterfowl)

   Score: 7

   Documentation:
   Grows very quickly in disturbed sites and altering the density of the layer in which it occurs.

   Sources of information:
   Maybury, 2005.

   D. Major, possibly irreversible, alteration or disruption of ecosystem processes (e.g., the species alters geomorphology and/or hydrology, affects fire frequency, alters soil pH, or fixes substantial levels of nitrogen in the soil making soil unlikely to support certain native plants or more likely to favor non-native species)

   Score: 10

   Documentation:
   Grows very quickly in disturbed sites and altering the density of the layer in which it occurs.

   Sources of information:
   Maybury, 2005.

1.2. Impact on Natural Community Structure

   A. No perceived impact; establishes in an existing layer without influencing its structure

   Score: 0

   Documentation:
   Grows very quickly in disturbed sites and altering the density of the layer in which it occurs.

   Sources of information:
   Maybury, 2005.

   B. Influences structure in one layer (e.g., changes the density of one layer)

   Score: 3

   Documentation:
   Grows very quickly in disturbed sites and altering the density of the layer in which it occurs.

   Sources of information:
   Maybury, 2005.

   C. Significant impact in at least one layer (e.g., creation of a new layer or elimination of an existing layer)

   Score: 7

   Documentation:
   Grows very quickly in disturbed sites and altering the density of the layer in which it occurs.

   Sources of information:
   Maybury, 2005.

   D. Major alteration of structure (e.g., covers canopy, eradicates most or all layers below)

   Score: 10

   Documentation:
   Grows very quickly in disturbed sites and altering the density of the layer in which it occurs.

   Sources of information:
   Maybury, 2005.

1.3. Impact on Natural Community Composition

   A. No perceived impact; causes no apparent change in native populations

   Score: 0

   Documentation:
   Grows very quickly in disturbed sites and altering the density of the layer in which it occurs.

   Sources of information:
   Maybury, 2005.

   B. Influences community composition (e.g., reduces the number of individuals in one or more native species in the community)

   Score: 3

   Documentation:
   Grows very quickly in disturbed sites and altering the density of the layer in which it occurs.

   Sources of information:
   Maybury, 2005.

   C. Significantly alters community composition (e.g., produces a significant reduction in the population size of one or more native species in the community)

   Score: 7

   Documentation:
   Grows very quickly in disturbed sites and altering the density of the layer in which it occurs.

   Sources of information:
   Maybury, 2005.

   D. Causes major alteration in community composition (e.g., results in the extirpation of one or several native species, reducing biodiversity or change the community composition towards species exotic to the natural community)

   Score: 10

   Documentation:
   Grows very quickly in disturbed sites and altering the density of the layer in which it occurs.

   Sources of information:
   Maybury, 2005.
### 1.4. Impact on other species or species groups

Cumulative impact of this species on the animals, fungi, microbes, and other organisms in the community it invades. Examples include reduction in nesting/foraging sites; reduction in habitat connectivity; injurious components such as spines, thorns, burrs, toxins; suppresses soil/sediment microflora; interferes with native pollinators and/or pollination of a native species; hybridizes with a native species; hosts a non-native disease which impacts a native species.

<table>

**Documentation:**
- Identify type of impact or alteration: Maybury reported "no evidence of disproportionate impacts on particular species" but no citations given.
- Sources of information: Maybury, 2005

### 2. Biological Characteristics and Dispersal Ability

#### 2.1. Mode and rate of reproduction

Provisional thresholds, more investigation needed.

<table>
<thead>
<tr>
<th>Reproduction Type</th>
<th>Score</th>
</tr>
</thead>
<tbody>
<tr>
<td>A. No reproduction by seeds or vegetative propagules (i.e. plant sterile with no sexual or asexual reproduction).</td>
<td>0</td>
</tr>
<tr>
<td>B. Limited reproduction (fewer than 10 viable seeds per plant AND no vegetative reproduction; if viability is not known, then maximum seed production is less than 100 seeds per plant and no vegetative reproduction)</td>
<td>1</td>
</tr>
<tr>
<td>C. Moderate reproduction (fewer than 100 viable seeds per plant - if viability is not known, then maximum seed production is less than 1000 seeds per plant - OR limited successful vegetative spread documented)</td>
<td>2</td>
</tr>
<tr>
<td>D. Abundant reproduction with vegetative asexual spread documented as one of the plants prime reproductive means OR more than 100 viable seeds per plant (if viability is not known, then maximum seed production reported to be greater than 1000 seeds per plant.)</td>
<td>4</td>
</tr>
<tr>
<td>U. Unknown</td>
<td>4</td>
</tr>
</tbody>
</table>

**Documentation:**
- Describe key reproductive characteristics (including seeds per plant): Single tree can produce millions of seeds; readily suckers and resprouts from root fragments.
- Sources of information: Mehrhoff et al., 2004; Maybury, 2005.

#### 2.2. Innate potential for long-distance dispersal

Examples include bird dispersal, sticks to animal hair,
buoyant fruits, pappus for wind-dispersal)
A. Does not occur (no long-distance dispersal mechanisms) 0
B. Infrequent or inefficient long-distance dispersal (occurs occasionally despite lack of adaptations) 1
C. Moderate opportunities for long-distance dispersal (adaptations exist for long-distance dispersal, but studies report that 95% of seeds land within 100 meters of the parent plant) 2
D. Numerous opportunities for long-distance dispersal (adaptations exist for long-distance dispersal and evidence that many seeds disperse greater than 100 meters from the parent plant) 4
U. Unknown

Score 4

Documentation:
Identify dispersal mechanisms:
Very numerous, light, winged seeds.
Sources of information:
Maybury, 2005; Invasives.org, 2008; authors' personal observations.

2.3. Potential to be spread by human activities (both directly and indirectly – possible mechanisms include: commercial sales, use as forage/revegetation, spread along highways, transport on boats, contaminated compost, land and vegetation management equipment such as mowers and excavators, etc.)
A. Does not occur 0
B. Low (human dispersal to new areas occurs almost exclusively by direct means and is infrequent or inefficient) 1
C. Moderate (human dispersal to new areas occurs by direct and indirect means to a moderate extent) 2
D. High (opportunities for human dispersal to new areas by direct and indirect means are numerous, frequent, and successful) 3
U. Unknown

Score 3

Documentation:
Identify dispersal mechanisms:
Sold and promoted as an ornamental, timber crop, and for revegetating disturbed areas.
Noted as a weed of nursery crops.

Sources of information:
Maybury, 2005.

2.4. Characteristics that increase competitive advantage, such as shade tolerance, ability to grow on infertile soils, perennial habit, fast growth, nitrogen fixation, allelopathy, etc.
A. Possesses no characteristics that increase competitive advantage 0
B. Possesses one characteristic that increases competitive advantage 3
C. Possesses two or more characteristics that increase competitive advantage 6
U. Unknown

Score 6

Documentation:
Evidence of competitive ability:
Perennial, fast growing, able to grow on poor soils.
Sources of information:
2.5. Growth vigor
A. Does not form thickets or have a climbing or smothering growth habit 0
B. Has climbing or smothering growth habit, forms a dense layer above shorter vegetation, forms dense thickets, or forms a dense floating mat in aquatic systems where it smothers other vegetation or organisms 2
U. Unknown

Documentation:
Describe growth form:
Does not form thickets.
Sources of information:
Maybury, 2005; authors' personal observations.

2.6. Germination/Regeneration
A. Requires open soil or water and disturbance for seed germination, or regeneration from vegetative propagules. 0
B. Can germinate/regenerate in vegetated areas but in a narrow range or in special conditions 2
C. Can germinate/regenerate in existing vegetation in a wide range of conditions 3
U. Unknown (No studies have been completed)

Documentation:
Describe germination requirements:
Needs open soil to germinate.
Sources of information:

2.7. Other species in the genus invasive in New York or elsewhere
A. No 0
B. Yes 3
U. Unknown

Documentation:
Species:
Weldy & Werier, 2008.

3. ECOLOGICAL AMPLITUDE AND DISTRIBUTION
3.1. Density of stands in natural areas in the northeastern USA and eastern Canada (use same definition as Gleason & Cronquist which is: “The part of the United States covered extends from the Atlantic Ocean west to the western boundaries of Minnesota, Iowa, northern Missouri, and southern Illinois, south to the southern boundaries of Virginia, Kentucky, and Illinois, and south to the Missouri River in Missouri. In Canada the area covered includes Nova Scotia, Prince Edward Island, New Brunswick, and parts of Quebec and Ontario lying south of the 47th parallel of latitude”)
A. No large stands (no areas greater than 1/4 acre or 1000 square meters) 0
B. Large dense stands present in areas with numerous invasive species already present or disturbed landscapes 2
C. Large dense stands present in areas with few other invasive species present (i.e. ability to 4

**3.5. Current introduced distribution in the northeastern USA and eastern Canada (see**
question 3.1 for definition of geographic scope

A. Not known from the northeastern US and adjacent Canada  
B. Present as a non-native in one northeastern USA state and/or eastern Canadian province. 
C. Present as a non-native in 2 or 3 northeastern USA states and/or eastern Canadian provinces. 
D. Present as a non-native in 4–8 northeastern USA states and/or eastern Canadian provinces, and/or categorized as a problem weed (e.g., “Noxious” or “Invasive”) in 1 northeastern state or eastern Canadian province. 
E. Present as a non-native in >8 northeastern USA states and/or eastern Canadian provinces, and/or categorized as a problem weed (e.g., “Noxious” or “Invasive”) in 2 northeastern states or eastern Canadian provinces. 
U. Unknown

Score  
Documentation:
Identify states and provinces invaded: 
MA, CT, RI, PA, NJ, NY. 
Sources of information: 
- See known introduced range in plants.usda.gov, and update with information from states and Canadian provinces. 

3.6. Current introduced distribution of the species in natural areas in the eight New York State PRISMs (Partnerships for Regional Invasive Species Management)

A. Present in none of the PRISMs 
B. Present in 1 PRISM 
C. Present in 2 PRISMs 
D. Present in 3 PRISMs 
E. Present in more than 3 PRISMs or on the Federal noxious weed lists 
U. Unknown

Score  
Documentation:
Describe distribution: 
See A2.3. 
Sources of information: 

4. FEASIBILITY OF CONTROL

4.1. Seed banks

A. Seeds (or vegetative propagules) remain viable in soil for less than 1 year, or does not make viable seeds or persistent propagules. 
B. Seeds (or vegetative propagules) remain viable in soil for at least 1 to 10 years 
C. Seeds (or vegetative propagules) remain viable in soil for more than 10 years 
U. Unknown

Score  
Documentation:
Identify longevity of seed bank:
Seed remain viable for at least 3 years.
Sources of information:
NBII/ISSG, 2005; authors' personal observations.

4.2. Vegetative regeneration
A. No regrowth following removal of aboveground growth 0
B. Regrowth from ground-level meristems 1
C. Regrowth from extensive underground system 2
D. Any plant part is a viable propagule 3
U. Unknown

Documentation:
Describe vegetative response:
Regrowth can occur after cutting.
Sources of information:
Maybury, 2005; author's (Moore's) personal observations.

4.3. Level of effort required
A. Management is not required: e.g., species does not persist without repeated anthropogenic disturbance. 0
B. Management is relatively easy and inexpensive: e.g. 10 or fewer person-hours of manual effort (pulling, cutting and/or digging) can eradicate a 1 acre infestation in 1 year (infestation averages 50% cover or 1 plant/100 ft²) 2
C. Management requires a major short-term investment: e.g. 100 or fewer person-hours/year of manual effort, or up to 10 person-hours/year using mechanical equipment (chain saws, mowers, etc.) for 2-5 years to suppress a 1 acre infestation. Eradication may be difficult, but possible (infestation as above). 3
D. Management requires a major investment: e.g. more than 100 person-hours/year of manual effort, or more than 10 person hours/year using mechanical equipment, or the use of herbicide, grazing animals, fire, etc. for more than 5 years to suppress a 1 acre infestation. Eradication may be impossible (infestation as above). 4
U. Unknown

Documentation:
Identify types of control methods and time-term required:
Can be controlled by cutting and applying herbicide to stumps; many sites occur on slopes making removal difficult.
Sources of information:
Tu, 2002; Maybury, 2005.

Section Four Total 7

Total for 4 sections Possible 90
Total for 4 sections 46

C. STATUS OF CULTIVARS AND HYBRIDS:

At the present time (May 2008) there is no protocol or criteria for assessing the invasiveness of cultivars independent of the species to which they belong. Such a protocol is needed, and individuals with the appropriate expertise should address this issue in the future. Such a protocol will likely require data on cultivar fertility and identification in both experimental and natural settings.
Hybrids (crosses between different parent species) should be assessed individually and separately from the parent species wherever taxonomically possible, since their invasiveness may differ from that of the parent species. An exception should be made if the taxonomy of the species and hybrids are uncertain, and species and hybrids cannot be clearly distinguished in the field. In such cases it is not feasible to distinguish species and hybrids, and they can only be assessed as a single unit.

Some cultivars of the species known to be available:
