**New York Invasiveness Rank §**

Moderate (Relative Maximum Score 50.00-69.99)

---

* For questions answered “unknown” do not include point value in “Total Answered Points Possible.” If “Total Answered Points Possible” is less than 70.00 points, then the overall invasive rank should be listed as “Unknown.”

†Calculated as 100(a/b) to two decimal places.

§Very High >80.00; High 70.00–80.00; Moderate 50.00–69.99; Low 40.00–49.99; Insignificant <40.00

**A. DISTRIBUTION (KNOWN/POTENTIAL): Summarized from individual PRISM forms**

A1.1. Has this species been documented to persist without cultivation in NY? (reliable source; voucher not required)

- [x] Yes – continue to A1.2
- [ ] No – continue to A2.1

A1.2. In which PRISMs is it known (see inset map)?

- [x] Adirondack Park Invasive Program
- [ ] Capital/Mohawk
- [x] Catskill Regional Invasive Species Partnership
- [x] Finger Lakes
- [x] Long Island Invasive Species Management Area
- [ ] Lower Hudson
- [ ] Saint Lawrence/Eastern Lake Ontario
- [ ] Western New York
NEW YORK
NON-NATIVE PLANT INVASIVENESS RANKING FORM

Documentation:
Sources of information:

A2.1. What is the likelihood that this species will occur and persist outside of cultivation, given the climate in the following PRISMs? (obtain from PRISM invasiveness ranking form)

Not Assessed: Adirondack Park Invasive Program
Not Assessed: Capital/Mohawk
Not Assessed: Catskill Regional Invasive Species Partnership
Not Assessed: Finger Lakes
Unlikely: Long Island Invasive Species Management Area
Not Assessed: Lower Hudson
Not Assessed: Saint Lawrence/Eastern Lake Ontario
Not Assessed: Western New York

Documentation:
Sources of information (e.g.: distribution models, literature, expert opinions):
Brooklyn Botanic Garden, 2009.

If the species does not occur and is not likely to occur with any of the PRISMs, then stop here as there is no need to assess the species.

A2.2. What is the current distribution of the species in each PRISM? (obtain rank from PRISM invasiveness ranking forms)

Distribution
Adirondack Park Invasive Program: Not Assessed
Capital/Mohawk: Not Assessed
Catskill Regional Invasive Species Partnership: Not Assessed
Finger Lakes: Not Assessed
Long Island Invasive Species Management Area: Not Present
Lower Hudson: Not Assessed
Saint Lawrence/Eastern Lake Ontario: Not Assessed
Western New York: Not Assessed

Documentation:
Sources of information:
Brooklyn Botanic Garden, 2009.

A2.3. Describe the potential or known suitable habitats within New York. Natural habitats include all habitats not under active human management. Managed habitats are indicated with an asterisk.

Aquatic Habitats
☐ Salt/brackish waters
☐ Freshwater tidal
☐ Rivers/streams
☐ Natural lakes and ponds
☐ Vernal pools
☐ Reservoirs/impoundments*

Wetland Habitats
☐ Salt/brackish marshes
☐ Freshwater marshes
☐ Peatlands
☐ Shrub swamps
☐ Forested wetlands/riparian
☐ Ditches*
☐ Beaches and/or coastal dunes

Upland Habitats
☐ Cultivated*
☐ Grasslands/old fields
☐ Shrublands
☐ Forests/woodlands
☐ Alpine
☐ Roadsides*

Other potential or known suitable habitats within New York:

Documentation:
Sources of information:
Brooklyn Botanic Garden, 2009.
B. INVASIVENESS RANKING
Questions apply to areas similar in climate and habitats to New York unless specified otherwise.

1. ECOLOGICAL IMPACT

1.1. Impact on Natural Ecosystem Processes and System-Wide Parameters (e.g. fire regime, geomorphological changes (erosion, sedimentation rates), hydrologic regime, nutrient and mineral dynamics, light availability, salinity, pH)

A. No perceivable impact on ecosystem processes based on research studies, or the absence of impact information if a species is widespread (>10 occurrences in minimally managed areas), has been well-studied (>10 reports/publications), and has been present in the northeast for >100 years.

B. Influences ecosystem processes to a minor degree (e.g., has a perceivable but mild influence on soil nutrient availability)

C. Significant alteration of ecosystem processes (e.g., increases sedimentation rates along streams or coastlines, reduces open water that are important to waterfowl)

D. Major, possibly irreversible, alteration or disruption of ecosystem processes (e.g., the species alters geomorphology and/or hydrology, affects fire frequency, alters soil pH, or fixes substantial levels of nitrogen in the soil making soil unlikely to support certain native plants or more likely to favor non-native species)

U. Unknown

Score

Documentation:
Identify ecosystem processes impacted (or if applicable, justify choosing answer A in the absence of impact information)
No studies on the impact on natural ecosystem processes located.
Sources of information:
Gravuer, 2005

1.2. Impact on Natural Community Structure

A. No perceived impact; establishes in an existing layer without influencing its structure

B. Influences structure in one layer (e.g., changes the density of one layer)

C. Significant impact in at least one layer (e.g., creation of a new layer or elimination of an existing layer)

D. Major alteration of structure (e.g., covers canopy, eradicating most or all layers below)

U. Unknown

Score

Documentation:
Identify type of impact or alteration:
Species can change the density and height (it can attain heights of 2 m.) of the herb layer.
Sources of information:
Voss, 1996; Nordon, 2002; Gravuer, 2005.

1.3. Impact on Natural Community Composition

A. No perceived impact; causes no apparent change in native populations

B. Influences community composition (e.g., reduces the number of individuals in one or more native species in the community)

C. Significantly alters community composition (e.g., produces a significant reduction in the population size of one or more native species in the community)

D. Causes major alteration in community composition (e.g., results in the extirpation of one or several native species, reducing biodiversity or change the community composition towards species exotic to the natural community)

Score
## Documentation:
Identify type of impact or alteration:

Significantly reduces the number of individuals of native species in community, including some rare species. Gravuer (2005): "Apparently threatens a number of rare wetland species, as Voss (1996) notes that its large spiny rosettes and densely prickly stems appear out of place next to Orchis rotundifolia and other rarities. Several communities it invades, such as bogs and fens, are also of conservation significance, and its ability to invade undisturbed vegetation suggests that it may pose a threat to high-quality examples of these." No evidence of major alteration in structure.

Sources of information:

### Impact on other species or species groups (cumulative impact of this species on the animals, fungi, microbes, and other organisms in the community it invades. Examples include reduction in nesting/foraging sites; reduction in habitat connectivity; injurious components such as spines, thorns, burrs, toxins; suppresses soil/sediment microflora; interferes with native pollinators and/or pollination of a native species; hybridizes with a native species; hosts a non-native disease which impacts a native species)

NEW YORK
NON-NATIVE PLANT INVASIVENESS RANKING FORM

Perennial, ability to grow on poor soil.
Sources of information:
Grauver, 2006.

2.5. Growth vigor
A. Does not form thickets or have a climbing or smothering growth habit 0
B. Has climbing or smothering growth habit, forms a dense layer above shorter vegetation, forms dense thickets, or forms a dense floating mat in aquatic systems where it smothers other vegetation or organisms 2
U. Unknown

Documentation:
Describe growth form:
Not known to form thickets or have a smothering growth habit; but specific conclusions not known.
Sources of information:
Grauver, 2005; author's pers. comments.

Score U

2.6. Germination/Regeneration
A. Requires open soil or water and disturbance for seed germination, or regeneration from vegetative propagules 0
B. Can germinate/regenerate in vegetated areas but in a narrow range or in special conditions 2
C. Can germinate/regenerate in existing vegetation in a wide range of conditions 3
U. Unknown (No studies have been completed)

Documentation:
Describe germination requirements:
Germination studies not known.
Sources of information:
Grauver, 2005

Score U

2.7. Other species in the genus invasive in New York or elsewhere
A. No 0
B. Yes 3
U. Unknown

Documentation:
Species:
Cirsium palustre is ranked as invasive in New York.

Score 3

3. ECOLOGICAL AMPLITUDE AND DISTRIBUTION

3.1. Density of stands in natural areas in the northeastern USA and eastern Canada (use same definition as Gleason & Cronquist which is: “The part of the United States covered extends from the Atlantic Ocean west to the western boundaries of Minnesota, Iowa, northern Missouri, and southern Illinois, south to the southern boundaries of Virginia, Kentucky, and Illinois, and south to the Missouri River in Missouri. In Canada the area covered includes Nova Scotia, Prince Edward Island, New Brunswick, and parts of Quebec and Ontario lying south of the 47th parallel of latitude”)
A. No large stands (no areas greater than 1/4 acre or 1000 square meters) 0

Total Possible 20
Section Two Total 20

</table>

**Documentation:**
Identify reason for selection, or evidence of weedy history:
- Size of stands in Northeast not quantified.
- Sources of information:
  - Grauver, 2005.

### 3.2. Number of habitats the species may invade

| A | Not known to invade any natural habitats given at A2.3 | 0 |
| B | Known to occur in two or more of the habitats given at A2.3, with at least one a natural habitat | 1 |
| C | Known to occur in three or more of the habitats given at A2.3, with at least two a natural habitat | 2 |
| D | Known to occur in four or more of the habitats given at A2.3, with at least three a natural habitat | 4 |
| E | Known to occur in more than four of the habitats given at A2.3, with at least four a natural habitat | 6 |
| U | Unknown | Score: 6 |

**Documentation:**
Identify type of habitats where it occurs and degree/type of impacts:
- See A2.3.
- Sources of information:

### 3.3. Role of disturbance in establishment

| A | Requires anthropogenic disturbances to establish. | 0 |
| B | May occasionally establish in undisturbed areas but can readily establish in areas with natural or anthropogenic disturbances. | 2 |
| C | Can establish independent of any known natural or anthropogenic disturbances. | 4 |
| U | Unknown | Score: 2 |

**Documentation:**
Identify type of disturbance:
- May occasionally establish in undisturbed areas but can readily establish in areas with natural or anthropogenic disturbances. Not known to require anthropogenic disturbance.
- Sources of information:
  - Grauver, 2005.

### 3.4. Climate in native range

| A | Native range does not include climates similar to New York | 0 |
| B | Native range possibly includes climates similar to at least part of New York. | 1 |
| C | Native range includes climates similar to those in New York | 3 |
| U | Unknown | Score: 1 |

**Documentation:**
- Describe what part of the native range is similar in climate to New York:
  - Northern Europe and Siberia; generally in cool climates more typical of northern NY but not all of NY; its invaded range reflects this as well.
3.5. Current introduced distribution in the northeastern USA and eastern Canada (see question 3.1 for definition of geographic scope)

A. Not known from the northeastern US and adjacent Canada 0
B. Present as a non-native in one northeastern USA state and/or eastern Canadian province. 1
C. Present as a non-native in 2 or 3 northeastern USA states and/or eastern Canadian provinces. 2
D. Present as a non-native in 4–8 northeastern USA states and/or eastern Canadian provinces, and/or categorized as a problem weed (e.g., “Noxious” or “Invasive”) in 1 northeastern state or eastern Canadian province. 3
E. Present as a non-native in >8 northeastern USA states and/or eastern Canadian provinces, and/or categorized as a problem weed (e.g., “Noxious” or “Invasive”) in 2 northeastern states or eastern Canadian provinces. 4
U. Unknown

Documentation:
Identify states and provinces invaded:
MA, MI, NH, NY, WI; ON, NS, QC.

Sources of information: See known introduced range in plants.usda.gov, and update with information from states and Canadian provinces.

3.6. Current introduced distribution of the species in natural areas in the eight New York State PRISMs (Partnerships for Regional Invasive Species Management)

A. Present in none of the PRISMs 0
B. Present in 1 PRISM 1
C. Present in 2 PRISMs 2
D. Present in 3 PRISMS 3
E. Present in more than 3 PRISMs or on the Federal noxious weed lists 4
U. Unknown

Documentation:
Describe distribution: See A1.1.

Total Possible 21
Section Three Total 15

4. DIFFICULTY OF CONTROL

4.1. Seed banks
A. Seeds (or vegetative propagules) remain viable in soil for less than 1 year, or does not make viable seeds or persistent propagules. 0
B. Seeds (or vegetative propagules) remain viable in soil for at least 1 to 10 years 2
C. Seeds (or vegetative propagules) remain viable in soil for more than 10 years 3
U. Unknown
### NEW YORK

Regrowth from ground level meristem where basal rosette of leaves is found.

**Sources of information:**
Gravuer, 2005.

#### Score 1

#### 4.3. Level of effort required

<table>
<thead>
<tr>
<th>Option</th>
<th>Score</th>
</tr>
</thead>
<tbody>
<tr>
<td>A. Management is not required: e.g., species does not persist without repeated anthropogenic disturbance.</td>
<td>0</td>
</tr>
<tr>
<td>B. Management is relatively easy and inexpensive: e.g. 10 or fewer person-hours of manual effort (pulling, cutting and/or digging) can eradicate a 1 acre infestation in 1 year (infestation averages 50% cover or 1 plant/100 ft²).</td>
<td>2</td>
</tr>
<tr>
<td>C. Management requires a major short-term investment: e.g. 100 or fewer person-hours/year of manual effort, or up to 10 person-hours/year using mechanical equipment (chain saws, mowers, etc.) for 2-5 years to suppress a 1 acre infestation. Eradication is difficult, but possible (infestation as above).</td>
<td>3</td>
</tr>
<tr>
<td>D. Management requires a major investment: e.g. more than 100 person-hours/year of manual effort, or more than 10 person hours/year using mechanical equipment, or the use of herbicide, grazing animals, fire, etc. for more than 5 years to suppress a 1 acre infestation. Eradication may be impossible (infestation as above).</td>
<td>4</td>
</tr>
<tr>
<td>U. Unknown</td>
<td>4</td>
</tr>
</tbody>
</table>

**Documentation:**
Identify types of control methods and time-term required:
Gravuer (2005): "This species may be somewhat more difficult to eradicate than other roadside weeds, as Voss (1996) noted that the typical program of roadside spraying and mowing employed in Michigan had failed to eradicate populations. For smaller infestations, manual control methods can be successful. Hand-pulling or digging out the rosettes is likely to be successful if sufficient time and labor are available (Nordin 2002, GLIFWC 2005, Wisconsin Department of Natural Resources 2005). Stems can also be cut near the ground before flowering occurs, but this must be done at least twice per season because of resprouting (GLIFWC 2005). For larger infestations, herbicides may be necessary. An herbicide specific for broad-leaved species may minimize collateral damage in grass-dominated ecosystems (Nordin 2002). If glyphosate is required, collateral damage can be minimized by cutting stems near ground level, then spraying a small amount of solution into the cut hollow stems (GLIFWC 2005). For heavily infested areas, biological control may offer the best chance for success. Unfortunately, no effective control agents for this species have yet been found (Nordin 2002). Regardless of the control program selected, yearly monitoring and treatment are probably necessary for several years or more (GLIFWC 2005)."
C. STATUS OF CULTIVARS AND HYBRIDS:

At the present time (May 2008) there is no protocol or criteria for assessing the invasiveness of cultivars independent of the species to which they belong. Such a protocol is needed, and individuals with the appropriate expertise should address this issue in the future. Such a protocol will likely require data on cultivar fertility and identification in both experimental and natural settings.

Hybrids (crosses between different parent species) should be assessed individually and separately from the parent species wherever taxonomically possible, since their invasiveness may differ from that of the parent species. An exception should be made if the taxonomy of the species and hybrids are uncertain, and species and hybrids can not be clearly distinguished in the field. In such cases it is not feasible to distinguish species and hybrids, and they can only be assessed as a single unit.

Some cultivars of the species known to be available:
