Relative maximum score ‡ 77.78

**New York Invasiveness Rank § High (Relative Maximum Score 70.00-80.00)**

* For questions answered “unknown” do not include point value in “Total Answered Points Possible.” If “Total Answered Points Possible” is less than 70.00 points, then the overall invasive rank should be listed as “Unknown.”

‡ Calculated as 100(a/b) to two decimal places.

§ Very High >80.00; High 70.00–80.00; Moderate 50.00–69.99; Low 40.00–49.99; Insignificant <40.00

Not Assessable: not persistent in NY, or not found outside of cultivation.

### A. DISTRIBUTION (KNOWN/POTENTIAL): Summarized from individual PRISM forms

A1.1. Has this species been documented to persist without cultivation in NY? (reliable source; voucher not required)

- Yes – continue to A1.2
- No – continue to A2.1

A1.2. In which PRISMs is it known (see inset map)?

- Adirondack Park Invasive Program
- Capital/Mohawk
- Catskill Regional Invasive Species Partnership
- Finger Lakes
- Long Island Invasive Species Management Area
- Lower Hudson
- Saint Lawrence/Eastern Lake Ontario
- Western New York

NEW YORK
NON-NATIVE PLANT INVASIVENESS RANKING FORM

B. INVASIVENESS RANKING
Questions apply to areas similar in climate and habitats to New York unless specified otherwise.

1. ECOLOGICAL IMPACT

1.1. Impact on Natural Ecosystem Processes and System-Wide Parameters (e.g. fire regime, geomorphological changes (erosion, sedimentation rates), hydrologic regime, nutrient and mineral dynamics, light availability, salinity, pH)

A. No perceivable impact on ecosystem processes based on research studies, or the absence of impact information if a species is widespread (>10 occurrences in minimally managed areas), has been well-studied (>10 reports/publications), and has been present in the northeast for >100 years.

B. Influences ecosystem processes to a minor degree (e.g., has a perceivable but mild influence on soil nutrient availability)

C. Significant alteration of ecosystem processes (e.g., increases sedimentation rates along streams or coastlines, reduces open water that are important to waterfowl)

D. Major, possibly irreversible, alteration or disruption of ecosystem processes (e.g., the species alters geomorphology and/or hydrology, affects fire frequency, alters soil pH, or fixes substantial levels of nitrogen in the soil making soil unlikely to support certain native plants or more likely to favor non-native species)

U. Unknown

Score 3

Documentation:
Identify ecosystem processes impacted (or if applicable, justify choosing answer A in the absence of impact information)
Due to large stature of individuals, reduces light availability for herbs below it in the herb layer. Impacts to other ecosystem processes and system wide parameters not known.
Sources of information:
Author's pers comm.

1.2. Impact on Natural Community Structure

A. No perceived impact; establishes in an existing layer without influencing its structure

B. Influences structure in one layer (e.g., changes the density of one layer)

C. Significant impact in at least one layer (e.g., creation of a new layer or elimination of an existing layer)

D. Major alteration of structure (e.g., covers canopy, eradicating most or all layers below)

U. Unknown

Score 7

Documentation:
Identify type of impact or alteration:
Large stands of Silphium perfoliatum can significantly impact the herb layer by increasing its density and height (individuals can reach up to 8').
Sources of information:
Barlow, 2006; author's pers. obs.

1.3. Impact on Natural Community Composition

A. No perceived impact; causes no apparent change in native populations

B. Influences community composition (e.g., reduces the number of individuals in one or more native species in the community)

C. Significantly alters community composition (e.g., produces a significant reduction in the population size of one or more native species in the community)

D. Causes major alteration in community composition (e.g., results in the extirpation of one or several native species, reducing biodiversity or change the community composition towards species exotic to the natural community)

U. Unknown

<tr>
<td></td>
<td>Barlow, 2006.</td>
</tr>
</tbody>
</table>

1.4. Impact on other species or species groups (cumulative impact of this species on the animals, fungi, microbes, and other organisms in the community it invades. Examples include reduction in nesting/foraging sites; reduction in habitat connectivity; injurious components such as spines, thorns, burrs, toxins; suppresses soil/sediment microflora; interferes with native pollinators and/or pollination of a native species; hybridizes with a native species; hosts a non-native disease which impacts a native species)

| A. Negligible perceived impact | 0 |
| B. Minor impact | 3 |
| C. Moderate impact | 7 |
| D. Severe impact on other species or species groups | 10 |

### 2. BIOLOGICAL CHARACTERISTICS AND DISPERSAL ABILITY

#### 2.1. Mode and rate of reproduction

| A. No reproduction by seeds or vegetative propagules (i.e. plant sterile with no sexual or asexual reproduction) | 0 |
| B. Limited reproduction (fewer than 10 viable seeds per plant AND no vegetative reproduction; if viability is not known, then maximum seed production is less than 100 seeds per plant and no vegetative reproduction) | 1 |
| C. Moderate reproduction (fewer than 100 viable seeds per plant - if viability is not known, then maximum seed production is less than 1000 seeds per plant - OR limited successful vegetative spread documented) | 2 |
| D. Abundant reproduction with vegetative asexual spread documented as one of the plants prime reproductive means OR more than 100 viable seeds per plant (if viability is not known, then maximum seed production reported to be greater than 1000 seeds per plant.) | 4 |
| U. Unknown | 4 |

#### 2.2. Innate potential for long-distance dispersal (e.g. bird dispersal, sticks to animal hair, buoyant fruits, pappus for wind-dispersal)
NEW YORK
NON-NATIVE PLANT INVASIVENESS RANKING FORM

A. Does not occur (no long-distance dispersal mechanisms) 0
B. Infrequent or inefficient long-distance dispersal (occurs occasionally despite lack of adaptations) 1
C. Moderate opportunities for long-distance dispersal (adaptations exist for long-distance dispersal, but studies report that 95% of seeds land within 100 meters of the parent plant) 2
D. Numerous opportunities for long-distance dispersal (adaptations exist for long-distance dispersal and evidence that many seeds disperse greater than 100 meters from the parent plant) 4
U. Unknown

Documentation:
Identify dispersal mechanisms:
Seeds are readily taken by birds and spread by water.
Sources of information:
Barlow, 2006; author's pers. obs.

Score 4

2.3. Potential to be spread by human activities (both directly and indirectly – possible mechanisms include: commercial sales, use as forage/revegetation, spread along highways, transport on boats, contaminated compost, land and vegetation management equipment such as mowers and excavators, etc.)

A. Does not occur 0
B. Low (human dispersal to new areas occurs almost exclusively by direct means and is infrequent or inefficient) 1
C. Moderate (human dispersal to new areas occurs by direct and indirect means to a moderate extent) 2
D. High (opportunities for human dispersal to new areas by direct and indirect means are numerous, frequent, and successful) 3
U. Unknown

Documentation:
Identify dispersal mechanisms:
Plant is sometimes grown; small seeds presumably could be readily spread along highways and through mowing equipment.
Sources of information:
Barlow, 2006; author's pers. obs., comm.

Score 3

2.4. Characteristics that increase competitive advantage, such as shade tolerance, ability to grow on infertile soils, perennial habit, fast growth, nitrogen fixation, allelopathy, etc.

A. Possesses no characteristics that increase competitive advantage 0
B. Possesses one characteristic that increases competitive advantage 3
C. Possesses two or more characteristics that increase competitive advantage 6
U. Unknown

Documentation:
Evidence of competitive ability:
Perennial, shade tolerant.
Sources of information:
Barlow, 2006; author's pers. obs.

Score 6

2.5. Growth vigor

A. Does not form thickets or have a climbing or smothering growth habit 0
B. Has climbing or smothering growth habit, forms a dense layer above shorter vegetation, forms dense thickets, or forms a dense floating mat in aquatic systems where it smothers 2
NEW YORK
NON-NATIVE PLANT INVASIVENESS RANKING FORM

other vegetation or organisms
U. Unknown

Documentation:
Describe growth form:
Form a dense layer above shorter vegetation.
Sources of information:
Barlow, 2006; author's pers. obs.

2.6. Germination/Regeneration
A. Requires open soil or water and disturbance for seed germination, or regeneration from
vegetative propagules. 0
B. Can germinate/regenerate in vegetated areas but in a narrow range or in special conditions 2
C. Can germinate/regenerate in existing vegetation in a wide range of conditions 3
U. Unknown (No studies have been completed)

Documentation:
Describe germination requirements:
Germination studies in the field not known. Reported from garden websites to germinate
readily in existing plots (iVillage Garden Web, 2009).
Sources of information:

2.7. Other species in the genus invasive in New York or elsewhere
A. No 0
B. Yes 3
U. Unknown

Documentation:
Species:
Silphium asteriscus, S. laciniatum reported from New York. Neither is tracked as invasive in

Total Possible 22
Section Two Total 19

3. ECOLOGICAL AMPLITUDE AND DISTRIBUTION
3.1. Density of stands in natural areas in the northeastern USA and eastern Canada
(use same definition as Gleason & Cronquist which is: "The part of the United States
covered extends from the Atlantic Ocean west to the western boundaries of
Minnesota, Iowa, northern Missouri, and southern Illinois, south to the southern
boundaries of Virginia, Kentucky, and Illinois, and south to the Missouri River in
Missouri. In Canada the area covered includes Nova Scotia, Prince Edward Island,
New Brunswick, and parts of Quebec and Ontario lying south of the 47th parallel of
latitude")
A. No large stands (no areas greater than 1/4 acre or 1000 square meters) 0
B. Large dense stands present in areas with numerous invasive species already present or
disturbed landscapes 2
C. Large dense stands present in areas with few other invasive species present (i.e. ability to
invade relatively pristine natural areas) 4
U. Unknown

Score 4
**Documentation:**
Identify reason for selection, or evidence of weedy history:
Stands over one quarter of an acre not directly reported; however, it is reasonably safe to assume from Barlow (2006) that at least some populations in the Au Sable River watershed are over one quarter an acre and occur in areas where few other invasives are present.
Sources of information:
Barlow (2004); author's pers. obs., comm.

### 3.2. Number of habitats the species may invade

<table>
<thead>
<tr>
<th>Option</th>
<th>Score</th>

<td>2</td>
</tr>
</tbody>
</table>
NEW YORK
NON-NATIVE PLANT INVASIVENESS RANKING FORM

D. Present as a non-native in 4–8 northeastern USA states and/or eastern Canadian provinces, and/or categorized as a problem weed (e.g., “Noxious” or “Invasive”) in 1 northeastern state or eastern Canadian province. 3

E. Present as a non-native in >8 northeastern USA states and/or eastern Canadian provinces. and/or categorized as a problem weed (e.g., “Noxious” or “Invasive”) in 2 northeastern states or eastern Canadian provinces. 4

U. Unknown

Score 4

Documentation:
Identify states and provinces invaded:
CT, MA, ME, NJ, NY, PA, VT; Ont. Other states in the Northeast where it occurs are native.
Voss (1996): "The species is native south and west of Michigan, barely entering the state, and is perhaps in part only adventive here…" Some have reported it to be native in New England and mid-Atlantic regions but most consider it to be non-native to these regions.
Sources of information: See known introduced range in plants.usda.gov, and update with information from states and Canadian provinces.

3.6. Current introduced distribution of the species in natural areas in the eight New York State PRISMs (Partnerships for Regional Invasive Species Management)

A. Present in none of the PRISMs 0

B. Present in 1 PRISM 1

C. Present in 2 PRISMs 2

D. Present in 3 PRISMs 3

E. Present in more than 3 PRISMs or on the Federal noxious weed lists 4

U. Unknown

Score 4

Documentation:
Describe distribution:
See A1.1.
Sources of information:

Total Possible 25
Section Three Total 23

4. DIFFICULTY OF CONTROL

4.1. Seed banks

A. Seeds (or vegetative propagules) remain viable in soil for less than 1 year, or does not make viable seeds or persistent propagules. 0

B. Seeds (or vegetative propagules) remain viable in soil for at least 1 to 10 years 2

C. Seeds (or vegetative propagules) remain viable in soil for more than 10 years 3

U. Unknown

Score U

Documentation:
Identify longevity of seed bank:
Seed longevity in soil not known.
Sources of information:
Author's pers comm.
NEW YORK
NON-NATIVE PLANT INVASIVENESS RANKING FORM

4.2. Vegetative regeneration
A. No regrowth following removal of aboveground growth 0
B. Regrowth from ground-level meristems 1
C. Regrowth from extensive underground system 2
D. Any plant part is a viable propagule 3
U. Unknown

Documentation:
Describe vegetative response:
Though this plant is a perennial, the vegetative response after cutting is not known by the author; literature also not clear on this.
Sources of information:
Author's pers. comm.

4.3. Level of effort required
A. Management is not required: e.g., species does not persist without repeated anthropogenic disturbance. 0
B. Management is relatively easy and inexpensive: e.g. 10 or fewer person-hours of manual effort (pulling, cutting and/or digging) can eradicate a 1 acre infestation in 1 year (infestation averages 50% cover or 1 plant/100 ft²). 2
C. Management requires a major short-term investment: e.g. 100 or fewer person-hours/year of manual effort, or up to 10 person-hours/year using mechanical equipment (chain saws, mowers, etc.) for 2-5 years to suppress a 1 acre infestation. Eradication is difficult, but possible (infestation as above). 3
D. Management requires a major investment: e.g. more than 100 person-hours/year of manual effort, or more than 10 person hours/year using mechanical equipment, or the use of herbicide, grazing animals, fire, etc. for more than 5 years to suppress a 1 acre infestation. Eradication may be impossible (infestation as above). 4
U. Unknown

Documentation:
Identify types of control methods and time-term required:
Sources of information:
Barlow, 2006.

C. STATUS OF CULTIVARS AND HYBRIDS:

At the present time (May 2008) there is no protocol or criteria for assessing the invasiveness of cultivars independent of the species to which they belong. Such a protocol is needed, and individuals with the appropriate expertise should address this issue in the future. Such a protocol will likely require data on cultivar fertility and identification in both experimental and natural settings.

Hybrids (crosses between different parent species) should be assessed individually and separately from the parent species wherever taxonomically possible, since their invasiveness may differ from that of the
parent species. An exception should be made if the taxonomy of the species and hybrids are uncertain, and species and hybrids can not be clearly distinguished in the field. In such cases it is not feasible to distinguish species and hybrids, and they can only be assessed as a single unit.

Some cultivars of the species known to be available:
